SYSTEM MANUAL

Version 2.8.20

This document contains information that is proprietary to Netronics Technologies Inc.

No part of this publication may be reproduced, modified, or distributed without prior written authorization of Netronics Technologies Inc.

This document is provided as is, without warranty of any kind.

Statement of Conditions

The information contained in this document is subject to change without notice.

Netronics shall not be liable for errors contained herein or for incidental or consequential damage in connection with the furnishing, performance, or use of this document or equipment supplied with it.

Information to User

Any changes or modifications of equipment not expressly approved by the manufacturer could void the user's authority to operate the equipment and the warranty for such equipment.

Regulatory Compliance

General Note

This system has achieved Type Approval in various countries around the world. This means that the system has been tested against various local technical regulations and found to comply. The frequency bands in which the system operates may be "unlicensed" and in these bands, the system can be used provided it does not cause interference.

FCC - Compliance

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generate, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.

Consult the dealer or an experienced radio/TV technician for help.

Changes or modifications to this equipment not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

It is the responsibility of the installer to ensure that when using the outdoor antenna kits in the United States (or where FCC rules apply), only those antennas certified with the product are used. The use of any antenna other than those certified with the product is expressly forbidden by FCC rules 47 CFR part 15.204.

It is the responsibility of the installer to ensure that when configuring the radio in the United States (or where FCC rules apply), the Tx power is set according to the values for which the product is certified. The use of Tx power values other than those, for which the product is certified, is expressly forbidden by FCC rules 47 CFR part 15.204.

Outdoor units and antennas should be installed ONLY by experienced installation professionals who are familiar with local building and safety codes and, wherever applicable, are licensed by the appropriate government regulatory authorities. Failure to do so may void the product warranty and may expose the end user or the service provider to legal and financial liabilities. Resellers or distributors of this equipment are not liable for injury, damage or violation of regulations associated with the installation of outdoor units or antennas. The installer should configure the output power level of antennas according to country regulations and antenna type.

- Where Outdoor units are configurable by software to Tx power values other than those for which the product is certified, it is the responsibility of the Professional Installer to restrict the Tx power to the certified limits.
- This product was tested with special accessories indoor unit (IDU or PoE), FTP CAT 5e shielded cable with sealing gasket, 12 AWG grounding cable - which must be used with the unit to insure compliance.

Indoor Units comply with part 15 of the FCC rules. Operation is subject to the following two conditions:

(1) These devices may not cause harmful interference.

(2) These devices must accept any interference received, including interference that may cause undesired operation.

Canadian Emission Requirements for Indoor Units

This Class B digital apparatus complies with Canadian ICES-003. Cet appareil numérique de la classe B est conforme à la norme NMB-003 du Canada.

China MII

Operation of the equipment is only allowed under China MII 5.8GHz band regulation configuration with EIRP limited to 33 dBm (2 Watt).

India WPC

Operation of the equipment is only allowed under India WPC GSR-38 for 5.8GHz band regulation configuration.

Unregulated

In countries where the radio is not regulated the equipment can be operated in any regulation configuration, best results will be obtained using Universal regulation configuration.

Safety Practices

Applicable requirements of National Electrical Code (NEC), NFPA 70; and the National Electrical Safety Code, ANSI/IEEE C2, must be considered during installation.

NOTES:

 A Primary Protector is not required to protect the exposed wiring as long as the exposed wiring length is limited to less than or equal to 140 feet, and instructions are provided to avoid exposure of wiring to accidental contact with lightning and power conductors in accordance with NEC Sections 725-54 (c) and 800-30.

In all other cases, an appropriate Listed Primary Protector must be provided. Refer to Articles 800 and 810 of the NEC for details.

- 2. For protection of ODU against direct lightning strikes, appropriate requirements of NFPA 780 should be considered in addition to NEC.
- 3. For Canada, appropriate requirements of the CEC 22.1 including Section 60 and additional requirements of CAN/CSA-B72 must be considered as applicable.

Table of Contents

Part 1: Basic Installation	
Chapter 1 Introduction	
Manual Structure	1-12
Terminology	1-13
Chapter 2 Introduction	
Welcome to NetStream!	2-15

Basic Installation

Chapter 1

About this User Manual

Manual Structure

This User Manual is divided into five functionally distinct sections reflecting the activities required to set up a NetStream link. The division is shown in the following table:

Section	General Content	Purpose
1	Basic Installation and Configuration	Core information to physically install a link: Site preparation and hardware Installation
2	Site Synchronization	Intra-site with Hub Site Synchronization, inter-site with the GPS Synchronization Unit
3	Advanced Installation Topics	Software upgrade, VLAN, QoS, Radar Mitigation, Dynamic Frequency Selection (Radar avoidance), Capacity upgrade
4	Field Installation Topics	Link Budget Calculator, Spectrum View, Web interface
5	Product Reference	Technical specifications, wiring tables, MIB reference

Table 1-1: User Manual - General layout

Typographical Convention

Where a term is defined or introduced for the first time, it is shown in **Boldface**.

Viewing and Printing

This manual is optimized for viewing online as a PDF file. To this end it uses an 11 point Calibri typeface for main text. Tables for most part, use 7 or 8 point fonts. Here are a few pointers for hard-copy printing:

- The text and table typefaces used are large enough to print the manual at two pages per sheet
- For good legibility, use a commercial grade laser printer. A color printer is of course best, however a monochrome printer set to use gray-scale gives acceptable results
- Better quality ink jet printers also give good output

Notifications

Notifications consist of Warnings, Cautions and Notes.

A Warning is a notification of risk of danger to persons operating near the equipment

A **Caution** is a notification of risk of damage to equipment or of service degradation

The purpose of a **Note** is to

- Draw your attention to something that may not be obvious or counterintuitive
- Emphasize a special feature or peculiarity of the NetStream
- Offer an external reference for additional information
- Add a caveat that would not qualify as a full Caution or Warning (see below)
- Provide additional background to what follows
- Offer a recommendation
- Highlight an indication of something to watch out for
- Advise you if an action has "side effects" i.e. it may disturb something else that would be best left undisturbed
- Remind you of something that should be kept in mind

Occasionally we use a Note as a Tip:

This is about a useful short-cut or method not otherwise obvious.

Terminology

- Universal bands refer to Netronics Universal bands as described above.
- 3.X or 3.X GHz refers to the frequency range 3.3 3.8 GHz
- BRS refers to the 2.5 GHz band subject to the FCC BRS regulations
- A 3.X ODU is an ODU pre configured to operate in the 3.X GHz licensed bands
- A 3.X Link in a NetStream link using a pair of 3.X ODUs
- **High Resolution Bands** Channel minimum step is 250 KHz. applies to 3.475 3.650 GHz IC, 3.4 -3.7 GHz ETSI and the 3.3 3.8 GHz Universal band.
- Low Resolution Bands Channel minimum step is 1 MHz. Applies to FCC regulations in the 3.650 3.675 GHz band.
- In the field, a link typically has a local or headquarters site as for example in Figure 1-1 above. Here the service provider is the local or headquarters site. The service recipient is the remote site.

Where the link is completely internal to a corporation, the choice of the local and remote is just a matter of convenience.

A link then, consists of two sites.

• In Broadband Wireless terminology, the local and remote sites are sometimes referred to as "near" and "far", "HQ" and "remote" and so on.

The site which is closer to the network core (often the local site) will be referred to as **site A**, and the opposite side of the link, usually closer to the end user, as **site B**.

This choice is application-neutral and will be used throughout the manual both to describe the sites and their names as in the examples.

• The link is configured and managed using a PC, the **managing computer** connected to site A. (The precise requirements for the managing computer are set out on page 29).

We will occasionally need to distinguish between the site to which the managing computer is connected, and the second site, when they are not necessarily A or B. The former will be called the **managing site** and the latter, **the over-the-air site**. Which is which, is always determined by the location of the managing computer.

- NetStream supports three connection methods for the managing computer:
 - Local a direct peer to peer connection between the Ethernet ports on the managing computer and the IDU or PoE device. Local connection is always readwrite.
 - Network the managing computer and the site A IDU or PoE device belong to a LAN and communicate through a router or switch
 - Over-the-air the managing computer connects to site B via the air interface
- The managing computer may be connected to the link through an IDU or a PoE device. In what follows, where ever we refer to an IDU it includes PoE devices unless stated otherwise. Typically, if we need to refer to an IDU as such, we will use a model name such as IDU-NetStream RM.
- The terms **uplink** and **downlink**, originate from the field of Satellite communications. In a backhaul or ISP context, **uplink** is from the user to the network and **downlink** is from the network to the user.

Chapter 2

Introduction

Welcome to NetStream!

NetStream is a portfolio of carrier-class wireless broadband radios in the sub-6 GHz range. These radios offer unmatched performance and robustness.

The NetStream portfolio consists of four product series:

- NetStream 5x25 and 5x10 Series supporting either 25 Mbps aggregate net throughput and up to 4 E1s/T1s or 10 Mbps aggregate net throughput, Ethernet only
- NetStream 5x50 Series supporting 50 Mbps aggregated net throughput and Up to 8 E1/T1
- NetStream 5x200 Series supporting 200 Mbps aggregate net throughput and up to 16 E1s/T1s
- NetStream 5x20 Series supporting 20 Mbps aggregate net throughput and up to 3 E1s or 4 T1s

What's in Release 2.8.20

GA 2.8.20 release is available as a software upgrade for eligible products as set out in the Compatibility section of the 2.8.20 Release Note.

The main changes in GA release 2.8.20 since the last GA release, 2.8.00 are:

Ethernet Hub Site Synchronization (EHSS)

EHSS may be used to collocate several NetStream radios without use of HSS cables and an external HSS unit. The conditions for its use are:

• The ODU hardware levels must be as in the following table:

Table 2-1: EHSS Support - Minimum Hardware levels

	1 1
Family	Hardware Level
NetStream 5x25	
and 5x10	4
NetStream 5x200	
and 5x50	9

• Ethernet connectivity is required between collocated units using any one of an IDU-NetStream RM, IDU-NetStream DT or IDU-DT6. Some EHSS highlights are:

- EHSS supports both Ethernet and TDM services
- EHSS configuration using the Link Manager is similar to that of the existing Serial HSS (SHSS)
- EHSS uses VLAN to separate EHSS sync signals from traffic
- EHSS enabled ODUs with a Sync port may be collocated with Serial HSS enabled units

SNMPv3 Support

- **Confidentiality** Encryption of packets to prevent unauthorized "snooping"
- Integrity Ensure that packets have not been tampered with in transit including an optional packet replay protection mechanism
- Authentication Validation of message source
- Security DES security level
- Applies to NetStream 5x25, 5x10, 5x50 and 5x200 series
- SNMPv1 support is retained for customers requiring it. Further, the newest releases of the Link Manager will continue to support SNMPv1 for ODUs not upgraded to the current release.

Extreme Cold Resistant Products

Variants of existing ODU and IDU-NetStream RM products capable of operating at temperatures as low as -55°C are available. Please contact Customer Support for details.

Backup and Restore Configuration Between Different ODUs

The Backup/Restore facility enables you to backup the ODU software and carry out a configurationonly or full software restore. Subject to certain limitations, you may also restore to another ODU of the same type.

New Regulations

5.8 GHz **ETSI** for 40 MHz channel bandwidth is available. You should ensure that it is permitted for your location.

Supported Frequencies Summary

Table 2-2: Frequencies for NetStream families (Other than 6.4 GHz)

NetStream Series	Frequency bands	Channel Bandwidth (MHz)	Capacity (Mbps)	TDMs
5x25 and 5x10		5/10/20	25, aggregate net throughput	4
			10, aggregate net throughput	
	 3.4 ETSI, 3.5 ETSI, 3.6 ETSI (*) 3.5 IC, Universal, 3.6 FCC/IC^a 	5/10/20	100, aggregate net throughput	16 E1/T1
5x200	 5.8 GHz FCC/IC 5.9 GHz Universal 5.7 GHz Universal 5.8 GHz MII China 5.8 GHz WPC India 5.4 GHz FCC (20 MHz) 5.4 GHz IC 5.4 GHz Universal 5.4 GHz IC 5.3 GHz IC 5.3 GHz FCC (20MHz) 5.3 GHz Universal 4.9 GHz Universal 4.9 GHz FCC/IC 4.8 GHz per Argentina Regulations 	5/10/20/40 ^b	200, aggregate net throughput	16 E1/T1
	4.9 GHz FCC, multi frequency 5.x GHz 5.8 GHz FCC/IC, multi frequency 5.x GHz		50, aggregate net throughput	8 E1/T1
	5.4 GHz ETSI, multi frequency 5.x GHz	5/10/20		
5x50	5.4 GHz Universal, multi frequency 5.x GHz			
	6.0 GHz Universal			
	5.8 GHz WPC	WPC		
	2.4 GHz ETSI	5/10/20/40		
	2.4 GHz Universal			
5x20	 3.4 ETSI, 3.5 ETSI, 3.6 ETSI 3.5 IC, Universal, 3.6 FCC/IC 	5/10/20	20, aggregate net throughput	3 E1/4 T1

a Supports restricted mode only

b Supports restricted mode only

- Table 1-1 applies both to integrated and connectorized ODUs.
- The NetStream 5x50 product include small form factor integrated models, connectorized for alternative use with external antennas
- (*) ETSI uses a split band as follows.
 3.403 3.490 GHz up to 16 dBm
 3.470 3.610 GHz up to 23 dBm
 3.590 3.710 GHz up to 25 dBm
 See also page 309.

Key Features of NetStream

» E1/T1 + Ethernet in one Solution

NetStream systems deliver carrier-class native E1/T1 + Ethernet in a single platform, making them ideal for a range of backhaul and access applications. Up to 16 E1/ T1 services are supported, depending on model.

» GbE support

GbE support is available for Ethernet services only using a GbE PoE device or IDU-GBE.

» High Capacity

The NetStream system provides a high-capacity link of up to 200 Mbps net aggregate throughput

» Superior Spectral Efficiency

Built on advanced MIMO and OFDM technologies, the NetStream system provides a high capacity link at channel bandwidths of 5, 10 and 20 MHz. These channel bandwidths supports high robustness of the air interface under interference and harsh conditions.

» Multi-band Products

Every NetStream Multi-band radio supports multiple frequency bands. The NetStream Multi-band products support the regulations of **FCC**, **IC** Canada, **ETSI** and **WPC** India. DFS is supported where required by regulation.

» Telco grade

Extremely robust performance under harsh weather conditions.

» Operates in nLOS/NLOS and dense environments

» Advanced Air Interface

The NetStream system provides an advanced air interface based on MIMO, antenna diversity and OFDM technologies, resulting in an exceptionally robust air interface and high frequency band granularity.

Using the following technologies, the NetStream air interface is designed to ensure nonstop, high quality transmission, even under interference and harsh conditions:

• Automatic Adaptive Rate (AAR) is a mechanism that dynamically adapts the air interface rate by changing both the signal modulation and coding.

- Automatic Channel Selection (ACS) chooses the best channel by monitoring the available radio channels and dynamically selecting a channel which is best suited for transmission at any given time.
- Automatic Repeat Request (ARQ) is a mechanism for error control during data transmission. When the receiver detects an error in the received information, it automatically requests the transmitter to resend the information. This process is repeated until the transmission is error free or the error continues beyond a predetermined number of maximum transmissions. NetStream ARQ mechanism is optimized for time critical traffic.
- Forward Error Correction (FEC) with very low overhead and algorithms specifically designed for the varying conditions of license-exempt frequency bands, ensuring fast, robust and error free communications.

» High transmission (Tx) power

The NetStream system supports high Tx power, compliant with radio regulations. High Tx power increases the system's availability and range, and enables the high performance with smaller antennas, thus reducing the total cost of the solution (lower CAPEX), installation and tower rent costs (lower OPEX).

The 5 GHz bands support a maximum Tx power of 25 dBm whereas the 2.4 GHz band supports a maximum Tx power of 26 dBm.

Maximum allowable Tx power may be limited by local regulations.

» Superior range performance - up to 120 Km/75 miles

The NetStream system supports high capacity at superior ranges. The Link Budget Calculator (Chapter 26) is used to determine the capacity and range according to the choice of product, antenna, type of service and environmental conditions.

» HSS Interoperability between NetStream radio products

In addition to the legacy Serial HSS, NetStream now supports Ethernet HSS, requiring nothing more than Ethernet connectivity between collocated ODUs. Ethernet HSS support is model dependent.

» Monitored Hot Standby (1+1):

The NetStream Monitored Hot Standby (MHS) protects up to sixteen E1/T1 services with NetStream. It is designed to provide high reliability high-capacity Point-to-Point Links. The NetStream MHS is –

- Designed to provide redundancy and high reliability for carrier class operators
- Optimized for high capacity links operating in license free bands
- A comprehensive solution providing protection against both equipment failure and loss of air interface, by simple connectivity between a primary link and a secondary link
- Able to use a different band for maximum protection to the air interface

The main *features* of the NetStream MHS are –

- Cut-over from the primary to the secondary link completely automatic
- Cut-over time no more than 50 ms

• Automatic restore to primary link as soon as it becomes available

A major *benefit* of NetStream MHS is that is can underpin an affordable Service Level Agreement structure.

MHS supports TDM services; Ethernet services are carried by both links independently.

» Spectrum View

Spectrum View displays a visual representation of spectrum availability during the link installation. It is an RF survey tool supporting the link installation prior to service activation. Use Spectrum View to assist you to choose the operating channel.

» Diversity

NetStream links using dual-pole antennas may be configured to transmit the same data through both radios. This feature provides added data transmission integrity under harsh conditions.

» Simple installation and management

NetStream systems are extremely simple to install and maintain. They are typically up and running in less than an hour.

The Link Manager application has full local and remote management capabilities. The user friendly SNMP based management tool provides full end-to-end configuration, event logging, and performance monitoring capabilities.

» Enhanced Security

The security features of NetStream include:

 NetStream AES 128-bit integrated advanced encryption support provides enhanced air interface security for carriers and private networks. It ensures user data protection with one of the most sophisticated commercially available combined encryption and authentication techniques, CCM/AES. This technique combines message authentication (preventing anti-spoofing and replay protection) with commercial encryption, and complies with the IEEE 802.11i (phase iii) security recommendations.

CCM/AES uses a symmetric 128-bit encryption key (EK), and a nonce, and provides both message encryption and authenticating signature. The nonce mechanism enables the receiver to remember already received genuine messages and reject all replayed messages.

- Initial encryption and authentication is based on a user-defined master key (Link Password). While standard Wireless LAN encrypts only the Ethernet Payload, the AES encrypts both the source and destination MAC addresses.
- In addition to normal log on access, Read or Write Community access is available at log on
- Link Lock is a part of the NetStream security concept. It is designed to discourage physical theft of units and "piggybacking" using an otherwise identical ODU to steal bandwidth or information. It locks a pair of synchronized ODUs for mutually exclusive communication.
- Supports SNMPv3

» SFP support in the IDU-NetStream RM and IDU-DT6

Standard SFP modules are used, enabling any type of Ethernet physical connectivity including various fibre connections. E3/T3 or E1/T1 over Ethernet SFPs can be used as well.

- » Separate management and traffic VLAN support
- » Ethernet Ring Topology
- » QoS Support (NetStream 100 based links)

QoS enables Operator and Service Providers to offer delay-sensitive services such as VoIP, IP-TV, time critical applications and online games.

» Web Based Management

Manage and control a NetStream link using a Web browser (MS Internet Explorer, Mozilla Firefox, Google Chrome) or from a **smartphone**.

Components of a NetStream Link

Major Components

A link consists of a pair of hardware-identical sites. The major element of each site is the ODU radio transceiver. The ODU actually contains two radios, which may be connected to a dual pole integrated or external antenna. The ODU itself is connected to a PoE device or an IDU that provides power and L2 ethernet data transport. The PoE or IDU provides an Ethernet LAN connection to user equipment (typically a switch).

Accessories

NetStream provides a variety of accessories to support the NetStream system:

- PoE devices Both Gigabit and 100 Mbps
- HSS unit Collocation unit for intra-site synchronization
- IDU-DT6 Aggregation unit for a collocated hub site instead of multiple PoE devices
- GSU for inter-site synchronization
- Antennas
- AC Power Adaptors
- ODU and antenna mounting kits
- Lightning protector for use with all Netronics outdoor products
- Ethernet repeater enables you to extend non-GbE PoE ODU cables beyond the 100 m limit
- CAT 5e cables of various lengths specifically for use with Netronics radios and PoE devices
- Grounding cables

Link Management Tools

Link Manager

The Link Manager is an SNMP-based management application which manages a complete link over a single IP address. It can also manage each side of the link separately.

The intuitive, easy-to-use Link Manager has a conventional graphical Microsoft Windows interface, and can be run locally and remotely.

The Link Manager provides:

- Installation Wizard
- Frequency band selection
- On-line monitoring of air interface quality allowing the administrator to monitor the service and status of each link
- On-line monitoring of equipment alarms
- Local and remote loopback testing
- Configuration Wizard and site settings
- Integrated software upgrade utility
- Spectrum View utility
- QoS management
- VLAN management
- On-line user manual and help files
- Link Budget Calculator for calculating the expected performance of the NetStream wireless link and the possible service configurations for a specific link range.

The Link Manager can easily be integrated with any SNMPv1 and SNMPv3 based NMS system.

Web Interface for Management

The Web Interface enables you to carry out basic link management functions using a Web browser. It is an easy way to rapidly configure and setup a link.

It may be used to -

- Establish a link on a minimal basis for Ethernet only
- Check link parameters and make basic changes
- View the link Inventory
- Inspect the Recent Events logs

Full details are supplied in Chapter 28.

Network Management System (NMS)

The Network Management System enables Service Providers to manage all NetStream links in their network from a Network Operations Center (NOC).

Using LNMS, Service Providers can configure and monitor up to 10,000 NetStream links¹. The intuitive easy-to-use LNMS provides a full range of network surveillance, monitoring, configuration and fault management capabilities. It offers users complete visibility and control over their Netronics-based networks.

^{1.} Depending on license type

Documentation supplied with NetStream

The technical documentation supplied with a NetStream, is located on the product CD. It includes the following items:

- A Quick Installation Guide for experienced installers (also hardcopy)
- A full User Manual the document which you are reading
- A Help file accessible from the Link Manager
- Link Budget Calculator

Chapter 3

Site Survey

Planning the Link Site

Overview

Link site planning consists of a set of surveys, which must be carried out before any equipment is brought to the site. If for some reason, the outcome of any of these surveys is negative, site relocation will need to be considered.

A Site Survey consists of three stages:

- Preliminary survey The proposed link is analyzed in the office using a topographic map.
- Physical survey The locations of the indoor and outdoor equipment are determined **on-site**.
- Radio Frequency (RF) survey It is recommended that the installation area be scanned with a spectrum analyzer, to identify RF interference so as to determine a clear channel for radio installation (**on-site**).

The Site Survey

Introduction

NetStream wireless links must be planned before installation. The designated installation site must be appraised to determine that the wireless system is able to operate efficiently and provide connectivity without signal degradation.

NetStream offers a wide operating frequency range. A free frequency channel must be determined within the operating range, for optimum performance.

Recommended Equipment

Stage 1: Preliminary Survey

- Topological map of the area
- Urban map of the area
- Compass

Stage 2: Physical Survey

• 100 meter tape measure

- Ohmmeter, to check ground connection
- Binoculars
- Map
- Digital camera
- Paper, pencil, and a clipboard
- GPS device (optional)
- Compass (optional)

Stage 3: RF Survey

- Spectrum Analyzer with Max Hold function and screen capture facility that can store multiple images, for documentation purposes
- RF accessories (connectors and cables)
- Communication devices (for example, cellular phones, or a set of walkie-talkies)

Stage 1: Preliminary Survey

A preliminary survey is necessary before visiting potential installation sites. As much details as possible should be obtained about the two designated ODU installation sites and the area between them.

To perform a preliminary survey:

- 1. Mark the two designated installation sites on a topographic map of the area.
- 2. Measure the distance between the sites; check that it is within the specified range of the equipment.
- 3. On the urban map, check for developed areas situated between the two installation sites. Pay attention to these areas when performing the physical site survey; there may be tall buildings, RF towers, or transmitters, which could cause interference to the link.
- 4. Check the area between the two sites for obstructions such as:
 - High ground hills or mountains
 - Lakes or large bodies of water. Water has a reflection effect on RF signals like a building. This type of reflection causes the received amplitude to be reduced. As a rule of thumb, the presence of a large body of water between the link sites may double the required antenna height.
- 5. Determine and record the compass bearings between both ODUs, relative to north.
- 6. If there are obstructions between the two sites, calculate the Fresnel Zone (see Chapter 26 for details).
- 7. If the site chosen does not meet requirements, consider alternative sites.
- 8. Use the Link Budget Calculator (available on the product page on Netronics website) to determine the expected performance.

Stage 2: Physical Survey

The physical site survey reviews the environment of the proposed installation location, to ensure that the link sites are suitable for the wireless network. The results of the physical site survey should be recorded.

It is advisable to go on a clear day, so you can more easily see any obstructions between the two sites.

> To perform a physical survey:

- 1. From the compass readings taken in the preliminary survey, find the azimuth (horizontal position) that the ODU should face towards the second ODU.
- 2. Using binoculars, locate any obstructions such as tall trees, high buildings, hills or mountains. Look for other RF towers between the two sites. Mark the locations of the obstructions on the map.
- Determine the location for the ODU (having regard for existing rooftop installations and tower space). It should be above any obstructions, considering the Fresnel zone (see Chapter 26).
- 4. If you need to install the ODU on a tower, make sure that the tower is far away from overhead electric power lines.
- 5. Determine a location for the indoor equipment; it should be as close as possible to the ODU. At an existing site, there is probably an equipment room with cable routing channels.

The IDU - ODU cable length limit is 100 m, in accordance with 10/100BaseT interface.

- 6. Measure and record the path length of the cable from the ODU position to the indoor equipment room.
- 7. Determine the ground and lightning connection points of the installation. The ODU and IDU must both be grounded.
- 8. Using the Ohmmeter, measure and record the resistance of the required installation to the grounding point. The resistance must be less than 10 ohm.
- 9. Review the results of the physical site survey. Decide if the site is suitable for the wireless network installation.
 - If the site is suitable, continue with stage 3, the RF survey
 - If the site is not suitable, survey another site

Additional Outdoor Site Requirements

The ambient outdoor operating temperature should be -35 to 60 °C (-31 to 140 °F).

Additional Indoor Site Requirements

The following requirements guarantee proper operation of the system:

- For IDU-NetStream RM units, allow at least 90 cm (36 ") of front clearance for operating and maintenance accessibility. Allow at least 10 cm (4 ") clearance at the rear of the unit for signal lines and interface cables
- The ambient operating temperature should be 0 to 50°C (32 to 122 °F) at a humidity of up to 90%, non condensing

Stage 3: RF Survey

The RF survey examines the wireless environment of the installation site, to determine whether there are available channels within the radio operating frequency band. An RF survey is performed using a spectrum analyzer.

It is advisable to familiarize yourself with the spectrum analyzer before going out on site, specifically the Max Hold and Marker functions.

You should perform the RF survey at both proposed link sites.

The survey should be carried out during a busy time of day, to best judge the worst case radio interference. Allow 2-4 hours duration for a good RF survey.

It is possible to install the link and use the Link Manager to find a clear channel. Each frequency channel can be evaluated in turn. Achievement of a clear channel is indicated by the marker in the Quality bar on the Channel Setting window (see Figure 6-6) moving into the green area.

RF Planning for Dense Installations and Collocated Sites

Interference may arise from

- Self interference from collocated NetStream radios
- Other collocated radio devices installed on the same site.

To avoid or minimize interference, follow these recommendations:

- For collocated NetStream units, use an HSS unit to synchronize between them. Select different operating channels for each collocated Netronics unit.
- If one or more collocated units are not Netronics units, ensure that there is a physical separation of at least three meters between a Netronics unit and any other collocated radio on the site.
- Use the largest possible frequency gap between these units.
- Choose the best frequency channel (as clear as possible form interference). You may have to use the Change Band facility available for all NetStream products.
- To select a frequency channel, move the link to **Installation Mode** (using Site configuration) and start the Installation wizard. In the **Channel Settings** window, use the quality bar at the bottom to help you choose a better channel (clearer of interference).
- Use the Spectrum View tool to find the best working channel (Tools | Spectrum View).
- Decreasing the Tx Power of a link will reduce collocation interference (Site Configuration | Air Interface).

RF Planning for Dense Installations and Collocated Sites

• Decreasing the Tx Power of a link will reduce collocation interference (Site Configuration | Air Interface).

Use the Link Budget Calculator (available on product page on Netronics website) to determine the minimum Tx Power required to maintain link stability.

Chapter 4

Hardware Installation

This chapter sets out the requirements and procedures for the hardware installation and alignment of a NetStream link in accordance with the prior planning as set out in **Chapter 3**. It is intended to guide qualified field technicians.

The material in this chapter is generic to all NetStream radio link products unless stated otherwise.

Outdoor units and antennas should be installed ONLY by experienced installation professionals who are familiar with local building and safety codes and, wherever applicable, are licensed by the appropriate government regulatory authorities. Failure to do so may expose the end user or the service provider to legal and financial liabilities. **NetStream** and its resellers or distributors are not liable for injury, damage or violation of regulations associated with the installation of outdoor units or antennas.

This chapter covers the following topics:

- Unpacking and checking supplied equipment:
 - ODUs
 - IDUs
 - PoE devices
 - IDU-DT6 aggregation unit
 - Antennas
 - Accessories
- Tools required for installation
- Safety practices
- Mounting an ODU
- Connecting an ODU
- Grounding and lightning protection for an ODU
- Network connection
- Powering up
- Establishing a radio link

What's in the box

Unpacking and Checking

> For each of the items below, do the following:

- 1. Remove the equipment from the box.
- 2. Check that everything listed on the included Bill of Materials or Proforma Invoice is present.
- 3. If any item is missing, contact Customer Service. You will be advised whether to return the package for replacement, or whether the missing item can be supplied separately.
- 4. Do not dispose of the packaging until the unit is installed and operational.

ODU Radios

A NetStream ODU package includes the following items:

• One ODU - see the next figure for front and rear view

Figure 4-1: Standard ODU Form Factors - All series other than A and B

Figure 4-2: Small form factor ODU: A and B series only

- An ODU mounting kit
- A CD containing -
 - the Link Manager
 - Quick Start Guide
 - User Manual the document you are reading
 - Link Budget Calculator
- A self-adhesive label showing the MAC address and the alternative Community string. You should keep this label in a safe place
- Cable glands (to be used with the ODU-IDU cable)

Further to Figure 4-2 above:

• Integrated Antenna ODU

This ODU has an integrated 370 mm (1.2 ft) flat panel antenna. The ODU contains both the radio and the antenna as a single unit housed in a weatherproof (IP67) case.

Connectorized ODU

This ODU has 2xN-type connectors for connecting an external antenna.

• Embedded (Connectorized) ODU

The Embedded ODU has two N-type connectors for an external antenna and a built-in low gain antenna.

• The small form factor ODU package

It also contains a special mounting kit adapter and two metal ties.

IDU- NetStream DT Package Contents

- IDU-NetStream DT
- AC/DC Converter
- IDU-NetStream DT wall-mounting drilling template
- Self adhesive label showing the IDU LED operation

Figure 4-3: IDU-NetStream DT - front view

IDU-NetStream DT: Rear panel

IDU-NetStream RM Package Contents

The IDU-NetStream RM package contains:

- IDU-NetStream RM see Figure 4-4 below.
- 19" rack mounting kit see Figure 4-6 below
- Two DC power plugs for power cables see Figure 4-6 below

Figure 4-4: IDU-NetStream RM Package contents - the IDU-NetStream RM, Ethernet only

Figure 4-5: IDU-NetStream RM Package contents - the IDU-NetStream RM, 16 E1/T1 ports

What's in the box

Figure 4-6: IDU-NetStream RM Package contents - the mounting kit and DC power plugs

Power over Ethernet (PoE) Devices

Basic PoE Device

The basic PoE device provides Ethernet service only, with power for the ODU. The PoE device is extremely compact, having one Ethernet port, one ODU port and a standard 3 pin male AC power socket.

It may be used with all NetStream radios.

Figure 4-7: Basic PoE device - showing the radio Ethernet port

GbE PoE Device

NetStream Gigabit Power over Ethernet (GbE PoE) device provides data and power to NetStream outdoor units. The PoE device is available with a variety of AC cables with different plug types.

This is the recommended PoE device for use with all NetStream radios.

The unit comes with a VAC cable. Both the cable length and plug are region dependent.

Figure 4-8: GbE PoE device

Outdoor (Ruggedized) DC PoE Device

The Outdoor (Ruggedized) DC PoE Device may be used for all Netronics radios. It will not support Gigabit performance. Two models are available using power input of 20 to 60 VDC or 10 to 30 VDC. The unit may be installed in a vehicle using respectively 24 VDC or 12 VDC power circuits.

Figure 4-9: Ruggedized DC-PoE Device

IDU-DT6 aggregation unit

The IDU-DT6 provides aggregation for multiple NetStream ODUs at a hub site. It supports all NetStream ODUs. It features –

- Six PoE ports (PoE legacy mode / Netronics PoE)
- Up to 25 W per PoE port
- 2 LAN Interfaces 10/100/1000 Mbps; auto-negotiation
- SFP Interfaces: 2 x SFP ports of 1000 Mbps (standard MSA)

It is 19" rack mounted, 1U and half width. Power feeding is 44 VDC – 56 VDC, Dual redundant inputs through standard IDU-NetStream RM type adapters.

Figure 4-10: IDU-DT6 front panel

The IDU-DT6 package contains:

- One IDU-DT6
- One short mounting ear
- One long mounting ear
- One dual connector to join two units mounted side by side
- Two DC power plugs for power cables see Figure 4-11 below

What's in the box

Figure 4-11: DC three pin power plug

The power connectors are 3 pin in line female, with polarities (left to right) minus, ground, plus. If required, an AC/DC power adapter should be ordered separately, depending on your region.

The IDU-DT6 may be installed in single or double configurations:

Figure 4-12: IDU-DT6 front view - single configuration

Figure 4-13: IDU-DT6 front view - double configuration

Antennas

An antenna is the radiating and receiving element from which the radio signal, in the form of RF power, is radiated to its surroundings and vice versa. The antenna gain and transmitting power may be limited by country regulations.

The NetStream may be operated with an integrated antenna that is part of the ODU unit, or with external antennas connected to the ODU via N-type connectors. All cables and connections must be connected correctly to reduce RF losses. The required antenna impedance is 50Ω .

The 5.x GHz Integrated Antenna ODU is provided with 370 mm (1.2 ft) flat panel antenna, with a gain of 23 dBi (5.x GHz) / 19 dBi (4.9 GHz) and 8° beam width. The 2.x GHz Integrated Antenna ODU is provided with 370 mm (1.2 ft) flat panel antenna, with a gain of 16 dBi and 16° beam width. The radio and the antenna are housed in a weatherproof case as a single unit.

What's in the box

Figure 4-14: ODU with integrated Flat Panel antenna

External Antennas

External antennas are available for the NetStream radios, varying in operating frequencies, form factor, size and gain, dual or single polarization.

The Flat Panel antenna shown below can be used either as an integrated or external antenna.

Figure 4-15: External Antennas for use with NetStream

Antenna Kits

External antennas are available for the NetStream radios, varying in operating frequencies, form factor, size and gain.

See the Netronics products catalog for a more detailed offering of external antennas. External A typical antenna kit contains -

- An antenna
- Two RF cables 1.2 m (4') long
- Mounting kit
Accessories

Hub Site Synchronization (HSS) Unit

The HSS unit synchronizes collocated ODUs to prevent self interference. It is particularly useful at a multi-sector base station employing several ODUs.

A single HSS unit supports up to ten collocated ODUs. In addition to each unit being connected to its PoE device, the collocated unit has an additional cable that is connected to the HSS Unit. The HSS Unit is a compact, weatherproof (IP67) connector box that is installed on the same mast as the ODUs. All collocated units connect to this box using an HSS cable. Cables in prepared lengths are available for purchase.

The HSS unit is supplied with ten protective covers; any port not in use must be closed with a protective cover.

Figure 4-16: HSS Interconnection Unit

See Chapter 11 and Chapter 12 for further details about the use of HSS.

GSS-U

The GPS-based synchronization unit (GSU) is designed to handle inter-site interferences under large-scale deployment scenarios.

The GSS-U is an outdoor unit consisting of GPS antenna and a PoE device.

The GSS-U is connected to the HSS Unit using a standard HSS cable. It synchronizes the transmission timing of multiple Hub-Sites to the same clock source thus eliminating self interference (see Chapter 14).

Figure 4-17: General GSU configuration

Lightning Protector Unit (LPU)

The use of lightning protection is dependent on regulatory and end user requirements. The NetStream ODU is designed with surge limiting circuits to minimize the risk of damage due to lightning strikes. It is designed for use with Netronics products.

Figure 4-18: NetStream Lightning Protector

The lightning protector incorporates high-power gas discharge tube and current transistor protection in a single protector unit. Technical specifications are shown in Appendix A.

Ethernet Repeater

The NetStream Ethernet repeater enables you to extend the IDU/PoE to ODU cable beyond the 100 m limit (but no more than 200 m). The unit looks physically like the lightning protection device in Figure 4-18. It's use is very simple as shown in the following schematic:

Figure 4-19: Using an Ethernet repeater with lightning protectors

The Ethernet repeater cannot be used with GbE IDU-ODU cables.

Tools required for installation

The following is a list of the equipment and materials required to install NetStream hardware.

Tools and Materials

- Crimping tool for RJ-45 (if the ODU-PoE cable is without connectors)
- Spanner/wrench 13 mm (½")
- Drill (for wall mounting only)
- Cable ties
- Sealing material
- Waterproofing tape such as Scotch 23 Tape ¾" wide, from 3M to ensure IP-67 compliant protection against water and dust

Cables and connectors

- ODU grounding cable 10 AWG
- ODU-PoE cable (outdoor class, CAT-5e, 4 twisted pairs, 24 AWG):
 - Up to 100 m for 100BaseT connection.
 - For a 1000BaseT connection (HBS only) use an ODU-PoE cable no longer than 75 m.

For 1000BaseT, you should use Netronics supplied ODU-PoE cables, which guarantees 1 Gb performance. Netronics cannot guarantee 1 Gb performance if you use third party cables

• External CAT-5e cable diameter should be between 7-9 mm to ensure waterproof sealing.

Safety Practices

Preventing Overexposure to RF Energy

To protect against overexposure to RF energy, install the ODUs so as to provide and maintain minimal separation distances from all persons.

When the system is operational, avoid standing directly in front of the antenna. Strong RF fields are present when the transmitter is on. The ODU must not be deployed in a location where it is possible for people to stand or walk inadvertently in front of the antenna.

Grounding

All Netronics products should be grounded during operation. In addition:

• All ODUs should be earthed by a wire with diameter of at least **10 AWG**.

NetStream ODUs must be properly grounded to protect against lightning. It is the user's responsibility to install the equipment in accordance with Section 810 of the National Electric Code, ANSI/NFPA No.70-1984 or Section 54 of the Canadian Electrical Code. These codes describe correct installation procedures for grounding the outdoor unit, mast, lead-in wire and discharge unit. It also lays down the size of grounding conductors and connection requirements for grounding electrodes. NetStream ODUs must be grounded to a Protective Earth in accordance with the Local Electrical Regulations.

• The earth lug on any IDU should be connected to the protective earth at all times, by a wire with a diameter of **18 AWG** or wider. Rack-mounted equipment should be mounted only in earthed racks and cabinets.

Further, you should -

- Always make the ground connection first and disconnect it last
- Never connect telecommunication cables to ungrounded equipment
- Ensure that all other cables are disconnected before disconnecting the ground

Protection against Lightning

The use of lightning protection is dependent on regulatory and end user requirements. All of Netronics outdoor units are designed with surge limiting circuits to minimize the risk of damage due to lightning strikes. Netronics recommends the use of additional lightning protector devices to protect the equipment from nearby lightning strikes.

General

- It is recommended that installation of the outdoor unit be contracted to a professional installer.
- Before working on equipment connected to power lines or telecommunication lines, you should remove jewelry or any other metallic object that may come into contact with energized parts.
- Use extreme care when installing antennas near power lines.
- Use extreme care when working at heights.
- When using an AC power source for Netronics devices, always use the AC power adapter supplied by Netronics.
- Use the right tools!
- Do not mount an ODU upside down or horizontally. Doing this may void you product warranty.

Internal ESD Protection circuits

Netronics equipment is designed to meet the ETSI/FCC/Aus/NZ/CSA EMC and Safety requirements. To fulfill these requirements, the system's Telecom lines at the ODU/PoE are Transformer-isolated and include internal ESD (Electro-Static-Discharge) Protection circuits.

Before Field Installing ODUs

Prior to installing ODUs in the filed, you might like to consider pre-loading them with their intended IP addresses. In a large dispersed network this would be done in the warehouse ahead of deployment. To do this, see **Chapter 25** for details.

Hardware Installation Workflow for a NetStream Link

Installing a Link

Site Survey

The Site Survey is carried out as described in **Chapter 3**. Recall that the Site Survey has three main steps:

- Stage 1: Preliminary Survey
- Stage 2: Physical Survey
- Stage 3: RF Survey

Site preparation

Site Preparation includes -

- Obtaining any necessary legal and statutory permits for installation of radio equipment
- Clearing physical obstructions as far as possible
- Erecting a mast or tower if required. A mast-sited ODU typically uses a pole attached to the mast.
- Installing a pole on a building wall if required
- Constructing a weather-proof cabinet to house a PoE device or other IDU if it is not to be housed indoors

- Ensuring availability of power, typically standard local AC power
- Ensuring that there is a LAN cable in place from the user's switch to the PoE/IDU location

Mounting a Standard Form Factor ODU

Use a mounting kit to mount the ODU on a pole as shown in the following figures

Figure 4-20: Standard form factor Standard Mounting kit

Figure 4-21: Large Clamp

Figure 4-22: Small Clamp

Table 4-1: Bill of Materials: Standard mounting kit

ltem No.	Description	Quantity
1	Large Clamp (see Figure 4-21)	1
2	Small Clamp (see Figure 4-22)	1
3	Arm (see Figure 4-23)	1
4	Screw hex head M8x40	4
5	Screw hex head M8x70	2
6	Washer flat M8	4
7	Washer spring M8 3	
8	M8 Nuts	2

Figure 4-23: Arm

Hardware Installation Workflow for a NetStream Link

Figure 4-24: Attaching the mounting kit to the pole

Figure 4-25: Mounting kit in place on the pole

Figure 4-26: Mounted connectorized ODU Netronics NetStream Family System Manual

Figure 4-27: Mounted ODU: Integrated antenna

Hardware Installation Workflow for a NetStream Link

The purpose of the arm (Figure 4-23), is to enable single-pole antennas (deprecated) to be rotated through 90° for correct vertical alignment or simply to distance the antenna or ODU from the pole.

Grounding the ODU

There is a grounding lug on the rear of the ODU as shown in **Figure 4-28**. Connect it to ground using 10 AWG wire. Grounding is often carried out in conjunction with lightning protection.

Figure 4-28: ODU: Grounding lug

Mounting a Small Form Factor ODU

A small form factor ODU mounting kit has a mounting kit adapter and two metal ties:

Figure 4-29: Small form factor ODU - Rear, metal tie

The mounting ties are threaded through the mounting slots provided and the unit mounted on a pole.

Figure 4-30: Mounting adapter

ltem No.	Description	Quantity
1	Metal ties	2
2	Mounting adapter	1
3	Screw M5x10, CSK, Phillips, stainless steel	2

Table 4-2: Mounting adapter kit for small form factor ODUs

The mounting adapter is used with the standard mounting kit shown in Figure 4-20. It is not included in the ODU package and must be ordered separately.

> To mount a small form factor ODU using a mounting kit:

1. Referring to Figure 4-31 below: Secure the adapter (3) to the rear of the ODU (2) using the two screws provided (4). Use a Phillips screwdriver set to a torque of 2.0 NM.

Figure 4-31: Securing the mounting adapter

2. Referring to Figure 4-32 below: Attach the ODU mounting kit (1) to the mounting adapter ear (4) and proceed as above, for a standard ODU.

Figure 4-32: Attaching a standard mounting kit

- Note
- When mounting an ODU on a pole or wall, ensure that the unit is oriented so that the cable connectors are at the bottom.
- Do not mount an ODU horizontally
- For an ODU with an integrated antenna: Do not tighten the ODU to its mounting bracket until the antenna alignment process is complete.
- Ensure that there are no direct obstructions in front of the ODU or interference from man-made obstacles.

Installing a PoE device

The PoE device (Figure 4-8) is a very simple piece of equipment. It has a recessed three pin AC power plug, a matching power cable, a LAN-In port (from a switch), a LAN-Out port (to the ODU) and a power LED, green under normal operation. It is typically strapped into a net-work equipment rack using plastic ties. It may also sit free on a tray or table-top.

Connecting the ODU to the PoE device

Connect the HBS to the LAN-Out port only. It will not work on the LAN-In port.

Connecting the PoE Device to a Network

Connect the PoE to network equipment such as a switch from the LAN-In port. Connecting network equipment to the LAN-Out port may damage it.

Powering up the ODU from a Poe Device

Connecting the ODU port labelled IDU to a powered up PoE is sufficient. If you have not already closed and weather-sealed the ODU IDU port, then inside it you can see an amber colored power LED which turn green when the ODU is configured. (See Chapter 6).

The IDU-DT6: An Alternative to PoE Devices

Using an IDU-DT6 instead of several PoE devices

The IDU-DT6 is an aggregation switch with the functionality of six PoE devices. It is ideal for use at a site having several collocated ODUs. It also affords the connectivity required to use Ethernet HSS for collocation (see **Chapter 13**).

Figure 4-33: IDU-DT6 front panel

Installing an IDU-DT6

The IDU-DT6 can sit on a table top, but is best installed in a rack using the supplied ears as in Figure 4-12 and Figure 4-13.

Connecting the ODU to an IDU-DT6

Connect the ODU IDU port to any of the six PoE ports of the IDU-DT6.

Connecting the IDU-DT6 device to a network

The IDU-DT6 has two LAN ports, either of which may be used for network connection.

Grounding and Powering Up the IDU-DT6

The IDU-DT6 has redundant power connection circuits. An enlarged view of the power connectors is shown in below:

Figure 4-34: IDU-DT6 power connectors, grounding lug and power plug.

- For direct DC connection: The connectors are 3 pin in line female, with polarities (left to right) minus, ground, plus.
- For AC connection: To avoid damage to the IDU-DT6, always use an AC/DC adapter and power plug supplied by Netronics.

Ground the unit with a 10 AWG wire before applying power.

IDU-DT6 - Functional Overview

Figure 4-35: IDU-DT6 front panel

The front panel is very straight forward: The SFP ports are standard. The LAN ports are Ethernet and support GbE. The six ODU WAN ports function identically to the LAN-Out port on a PoE device.

The IDU-DT6 LEDs

Table 4-3: IDU-DT6 LED Indicators

Port	Green	Yellow
WAN (2xRJ45 LEDs)	Link / Activity	Duplex or Port's PoE status (configurable)
LAN (2xRJ45 LEDs)	Link / Activity	Duplex
SFP (2 panel mounted LEDs)	Link / Activity	Duplex

Installing an IDU-NetStream DT

The IDU-NetStream DT can be wall mounted, placed on a desktop or take up one half of a 1U rack slot. The unit looks deceptively like a simple domestic router: It is not. It must be properly grounded, cabled to the ODU and connected to power using the supplied AC/DC adapter.

Figure 4-36: IDU-NetStream DT: Rear panel

Although the three pin power plug is physically similar to that of the other IDUs, the power requirements are quite different:

Figure 4-37: IDU-NetStream DT power connector, grounding lug and power plug

- For direct DC connection: The connector is a 3 pin in line female, with polarities (left to right) minus, ground, plus.
- For AC connection: To avoid damage to the IDU-DT6, always use an AC/DC adapter and power plug supplied by Netronics.

IDU-NetStream DT LEDS

The IDU-NetStream DT LEDs share the same functionality as the corresponding IDU-NetStream RM LEDs. They are described in the next section.

Mounting the IDU-NetStream RM

Figure 4-38: IDU-NetStream RM Package contents - the IDU-NetStream RM, 16 E1/T1 ports

IDU-NetStream RMs are all rack mountable, as shown in Figure 4-39. A front panel keyed schematic of a rack mounted IDU-NetStream RM is shown in the figure below.

Figure 4-39: IDU-NetStream RM front panel

Further description of the keyed items in Figure 4-39 is shown in Table 4-4 below:

Кеу	Label	Remarks
Α	Indicator LEDs	See Figure 4-40.
В	ODU Port	RJ-45 connector, see Table B-1.
с	LAN RJ45Ports	Ethernet, RJ-45 connector, see Table B-3.
D	LAN SFP Port	See Appendix C.
E	Alarm Ports	Standard DB25 female connector, see Table B-7.
F	Label indent	Place for adhesive identification labels.
G	Primary 3 pin Power Connector	
н	Secondary 3 pin Power Connector	Standard 3 pins in line power connector, see Table B-8.
I	Grounding Lug	Use the lug supplied.
J	Rack mounting holes	

Table 4-1: Components of an IDU-NetStream RM front panel

Hardware Installation Workflow for a NetStream Link

к	Detachable Rack mounting brackets	
L	0, 4, 8 or 16 E1/T1 Ports	See Table B-4.
м	Standby Port	Hot Standby ready: HSB cable socket, see Table B-5.

The Indicator LEDs (Item A in Table 4-4 above) are shown in more detail below:

Figure 4-40: IDU-NetStream RM Front Panel LEDs

The IDU-NetStream DT Front Panel LEDS look like this and are functionally the same as the IDU-NetStream RM LEDs.

HSS	SERVICE	LINK	ODU	IDU	PWR
0	0	0	0	0	0

Figure 4-41: IDU-NetStream DT Front Panel LEDs

The purpose of the LEDs is shown in Table 4-5 below:

Table 4-5: IDU-NetStream	RM Front Panel LEDs
--------------------------	----------------------------

Name	Color	Function
IDU	Green Blinking Green Red Blinking Orange	IDU operational During power-up only Failure During power-up; continues if ODU fails to load IDU firmware. Also, when using an IDU-NetStream RM to replace a PoE device in which case all other LEDs off.
ODU	Green Red	ODU-to-IDU communication link is operating ODU-to-IDU communication link is disrupted
AIR I/F	Green Orange Red	Wireless link is synchronized During installation mode; also signals software mismatch on some identical ODUs Wireless link lost synchronization
SVC	Green Orange Blinking Orange Red Off	E1 or T1 line is synchronized Alarm detected at the opposite site interface; Normal or LOSS Local or remote loopback Alarm detected at this site interface Ethernet only IDU or E1/T1 not configured
HSS	See supplementary	Table 4-6 following.

Name	Color	Function		
		Hot Standby Mode - for use with Trunks only	Link State	
	Green	Primary	Active	
	Blinking Green	Secondary	Not active	
	Red	Primary	Not active	
	Orange	Secondary	Active	
Off STBY Green Blinki Red	Off	Off	HSM not activated	
		Hot Standby Mode - For use with Ethernet only in a 1+1 Ring application)	Link State	
	Green			
	Blinking Green			
	Red	Hardware ready		
	Orange			
	Off			

Table 4-5: IDU-NetStream RM Front Panel LEDs (Continued)

Table 4-6: IDU-NetStream RM and New Style IDU-NetStream DT Front Panel LEDs for HSS

Color	Function
Green	This ODU is HSS master, generating signal, and HSS Sync is OK
Blinking Green	This ODU is a HSS client and in Sync
Red	HSS not operational due to improper signal detection. This ODU is not transmitting
Orange	 HSS is operational. One of the following conditions apply: This ODU is a master that is generating signals and detecting signals This ODU is a master that is generating signals but detected improper signals This ODU is a client "Continue Tx" but is not detecting signals This ODU is a client "Disable Tx" and is detecting signals from multiple sources All orange cases transmit.
Off	HSS is not activated Disconnection between ODU and IDU

To mount an IDU-NetStream RM (The keys refer to Figure 4-39):

- 1. Attach the rack mounting brackets (K) to the IDU.
- 2. Bolt the IDU into an empty slot in the rack, ensuring that it sits securely.
- 3. Ground the IDU to the rack using grounding lug I. The IDU should be left permanently grounded.

Instead of using the rack mounting brackets, the IDU may be rail mounted using the four screw holes on each of its sides.

Mounting External Antennas

Mounting a Flat Panel External Antenna

Typically, a flat panel antenna such as that shown in **Figure 4-15** is used. It has four bolts for a mounting kit adapter.

Figure 4-42: Flat panel antenna mounting kit adapter

It is mounted on a pole in exactly the same manner as the ODU itself using the adapter shown in **Figure 4-42**. The left hand view in shows the knurled surface adjacent to the mounting kit ear. The right hand view shows the recess for the mounting kit holding nut.

Figure 4-43: Flat Panel antenna - rear with mounting kit adapter

Figure 4-44: Flat Panel antenna - mounted

Other Antenna Types

Many of the antennas of the types shown in Figure 4-15 use the standard mounting kit of Figure 4-20. Some third party antennas use pole clamps, similar to those shown below:

Figure 4-45: Pole clamps for external antennas

Grounding an External Antenna

External antennas should be individually grounded using a suitable Grounding Kit such as an Andrew Type 223158-2 (http://www.commscope.com).

Do not stand in front of a live antenna.

Mounting the Lightning Protection Devices

The use of lightning protection is dependent on regulatory and end user requirements. The NetStream ODU is designed with surge limiting circuits to minimize the risk of damage due to lightning strikes. Netronics recommends the use of additional lightning protector devices to protect the equipment from nearby lightning strikes.

In what follows, ODU may be any type of Netronics outdoor radio unit and IDU may be any type of NetStream IDU used with such products (PoEs, IDU-DT6, IDU-NetStream RM etc.)

Figure 4-46: Netronics Lightning Protection Kit

|--|

Item	Quantity	View/Remarks
LPU (shown wrapped)	1	Hearten
U wall clamp	1	

Item	Quantity	View/Remarks
RJ-45 connectors (shown wrapped)	2	
0.5m CAT-5e cable	1	
Metal tie	1	\bigcirc
Quick Installation Guide	1	Pamphlet

Table 4-7: LPU Kit contents (Continued)

For any type of IDU-ODU connection, lightning protection units (LPUs) are installed in pairs, as shown in the next figure:

Figure 4-47: Basic use of lightning protectors

Hardware Installation Workflow for a NetStream Link

To install a LPU on a pole adjacent to an ODU (HBS or HSU):

- 1. Mount one LPU on the ODU pole, as close as possible to the ODU.
- 2. Ground the LPU to the pole using the grounding lug.
- 3. Connect the 0.5 meter CAT-5e cable to the IDU port of the ODU.
- 4. Connect the other end of the cable to the top of the LPU.
- 5. Tighten the top cable LPU gland cap.
- 6. Connect the main ODU-IDU cable from the IDU to the bottom end of the LPU.
- 7. Tighten the bottom cable LPU gland cap.
- 8. Run the main ODU-IDU cable towards the IDU location.
- Insulate both LPU connections. See the next section, Additional Consideration for Waterproofing below.

> To install a LPU on a wall adjacent to an IDU (PoE or IDU-DT6):

- 1. Use the supplied wall clamp to mount the second LPU as close as possible to the indoor access point to the IDU.
- 2. Ground the LPU to an earth strip using the grounding lug.
- Remove the top cable LPU gland cap together with the rubber sealing tube.
- 4. Thread the IDU cable from the upper

LPU, through the removed cap from the previous step.

- 5. Plug it in to the top of the LPU.
- 6. Screw down and tighten the LPU cap.
- 7. Connect the 0.5 m CAT-5e cable to the Bottom of the LPU.
- 8. Connect the other end (via the indoor access point) to the IDU.

 Insulate both LPU connections. See the next section, Additional Consideration for Waterproofing below.

Additional Consideration for Waterproofing

Lightning Protectors and Ethernet Repeaters

If these units are installed at locations heavily exposed to heavy dust, rain or corrosive moisture (for example, close to the sea), you should protect them further as in the following procedure. In the remainder of this section, "unit" refers to either a Lightning Protection Unit or a Repeater.

> To seal a unit against excessive dust and moisture:

- 1. Obtain a high quality sealing material such as Scotch 23 Tape ¾" wide, from 3M to ensure IP-67 compliant protection against water and dust.
- 2. Cut two pieces each 25 cm long, of Scotch 23 splicing tape. Remove the plastic cover to expose the tacky side of the sealing tape as shown in Figure 4-48.

Figure 4-48: Exposing the tack side of the sealing tape

- 3. After connecting the short CAT-5 IDU/ODU cable (provided in the box) from the ODU to the unit, tighten the cable gland cap firmly and use the insulation tape scotch 23 to fully cover both of the cable glands.
- 4. Connect the tape with tacky side up on the cable gland cap and the CAT-5 cable. Start at Start Point at the bottom of the cable gland as shown in Figure 4-49. Finish at End Point of the CAT-5 cable, 2.5 cm after the end of the shrink tubing. Stretch the tape and apply half-overlapped to form gap-free joint.

Figure 4-49: Start and End points for protective-taping the unit

5. Wrap two layers of any scotch vinyl plastic electrical type (e.g Scotch Super 88 Vinyl Plastic Tape from 3M) to protect the joints as shown in Figure 4-50. Ensure that the bottom of the cable gland and the end of the CAT-5 cable are covered with the sealing splicing tape and with vinyl plastic tape.

Figure 4-50: Protecting the unit joints with vinyl tape

6. Mount the unit on the pole using the mounting ring as shown in **Figure 4-51**. Ground the unit using the GND screw. For lightning protection, repeat the same procedure to install the second unit connected to the IDU.

Figure 4-51: Mounted and strapped to the pole

External Ports for CAT-5e Cables

All external ODU ports should be water sealed. Use the same materials and method as for the LPU cable glands.

Mounting the Ethernet Repeater

The Netronics Ethernet repeater enables you to extend the PoE to ODU cable beyond the 100 m limit (but no more than 200 m). The unit looks physically like the lightning protection device in **Figure 4-18**. It's use is very simple as shown in the following schematic:

Connecting and Aligning ODUs / Antennas

Figure 4-52: Using an Ethernet repeater with lightning protectors

The Ethernet repeater cannot be used with GbE IDU-ODU cables.

Connecting an ODU to an IDU

The ODU-IDU cable conducts all the user traffic between the IDU and the ODU, and also provides power to the ODU. The maximum length of the ODU-IDU cable is 100 m (328 ft) in accordance with 10/100BaseT standards.

The ODU-IDU cable is supplied pre-assembled with RJ-45 connectors, at the length specified when ordering, or as a cable drum with spare connectors. If the ODU-IDU cable was not ordered, use an outdoor class, CAT 5e 24 AWG shielded cable. See **Appendix B** for Wiring Specifications.

To connect the ODU to the IDU, route the cable from the ODU to the IDU, secure the cable along its path and connect the cable to the ODU RJ-45 connector on the IDU (see item B in Figure 4-39 above).

Connecting User Equipment

1. Connect user switch/router or any other compatible device to one of the IDU panel RJ-45 ports designated LAN. (For an IDU-NetStream RM, see item C in Figure 4-39 above. For an IDU-DT6 see Figure 4-10 above.)

- 2. Connect user E1/T1 traffic to the IDU panel RJ-45 ports designated TRUNKS. (For an IDU-NetStream RM, see labeled item L in Figure 4-39 above).
- 3. IDU-NetStream RM and IDU-DT6 only: To use the SFP Port(s) (see Figure 4-39 and Figure 4-10 above), insert an SFP plug-in module into the port and connect the user switch/ router or any other compatible device to the SFP plug-in module.

Refer to Appendix B for connector pin outs.

Do not connect two LAN ports to the same network, or flooding may occur.

For TDM Users

You may use SFP units configured for TDM with the IDU-DT6. Be aware however, than the TDM performance will be limited to TDM over Ethernet. If you require native mode TDM performance, you should use an IDU-NetStream DT or an IDU-NetStream RM.

Connecting and Aligning ODUs / Antennas

You perform antenna alignment using the ODU's buzzer.

To speed up the installation time, alignment of a NetStream system should be performed by two teams simultaneously, at site A and at site B.

> To align ODUs with integrated antennas or external dual-pole antennas:

- 1. For external dual-pole antennas: Using a coax cable with N-Type connectors, connect the vertical polarization connector of the antenna to the ANT 1 connector of the ODU.
- 2. For external dual-pole antennas: Using a coax cable with N-Type connectors, connect the horizontal polarization connector of the antenna to the ANT 2 connector of the ODU.
- 3. Ensure that power is connected to the IDUs at both sites.
- 4. Ensure normal operation of the IDUs by the LED indications on the front panel.

Provided that site A detects the signal from site B, the ODU starts beeping 20 seconds after power up, and continues beeping until the ODUs are aligned, and the installation is complete.

In the following steps, "antenna" refers both to an external antenna and an integrated antenna.

5. Direct the antenna of site B in the direction of site A. This is simplified if a previous site survey has been completed and azimuths are known.

When aligning the antennas, do not stand in front of a live antenna.

- 6. Make a horizontal sweep of 180 degrees with the site A antenna so that the strongest signal from site B can be detected.
- 7. Slowly turn the site A antenna back towards the position of site B, listening to the tone until the best signal is reached. See the following figure for audible signal variations.

Figure 4-53: Beep Sequence for antenna alignment

- Three beeps and a pause is 'best signal so far'
- Two beeps and a pause is 'signal quality increased'
- One beep and pause is 'no change in signal'
- Long beep and short pause is 'signal quality decreased'
- One beep and a long pause is 'no air link'
- Any other signal does not relate to antenna alignment
- 8. Secure the site A antenna to the pole/wall.
- 9. Repeat steps 4 to 8 for site B.

Getting started with the Link Manager

Installing the Link Manager Application

Minimum System Requirements

The Link Manager application is distributed on a CD. Operating system specific PC resources required by the application are set out in Table 5-1 below:

		Windows Version				
	XP Pro	Vis	ı/7			
		32 bit	64 bit			
Memory	512 Mb	1 Gb	2 Gb			
Processor	PIV	P IV Dual Core				

Table 5-1: PC Requirements for the Link Manager Application

Requirements common to all systems are:

- Hard disk: 1 GB free space
- Network: 10/100BaseT NIC
- Graphics: 1024x768 screen resolution with 16 bit color
- Microsoft Explorer version 5.01 or later

Installing the Software

Any PC running the Link Manager application can be used to configure a NetStream link.

To install the Link Manager program:

- 1. Insert the CD-ROM into your CD-ROM drive. The installation starts automatically.
- 2. Follow the on-screen instructions of the installation wizard to complete setup of the Link Manager program in the desired location.

Getting Started with the Link Manager

If your links are within easy reach, you can configure them using the procedure described below. If however, your links are to be geographically scattered, it may be convenient to pre-load each ODU with its network address prior to physical installation. The procedure is quite straight forward, and set out in Chapter 25.

Each ODU requires a static IP address, since part of the link definition is the IP address pair of both ODUs. Network Managers should ensure that these addresses are outside of the automatic allocation ranges used by their network DHCP server.

To start the Link Manager:

1. Connect the managing computer to one of the two LAN ports as shown in Figure 5-1 below:

Figure 5-1: LAN ports on the front panel of the IDU-NetStream RM

unit.

For IDU-NetStream DT users: The LAN ports are located on the rear panelon the

 From release 2.6 and higher, LAN ports support GbE (10/100/1000 Mbps)

If you are not using a direct connection as above, ensure that you have IDU to managing computer connectivity (e.g. through a LAN).

2. Check that you have connectivity to the ODU. You can do this by opening up a command line session (**Start|Run** and then type, **cmd**). At the command prompt, type

ping 10.0.0.120

You should see something like this:

Figure 5-2: Pinging an uninstalled and un-configured link

Any other response from ping means that the ODU is not responding. Check your Ethernet connection and that both the IDU and ODU are switched on and then try again. If you do not succeed, seek assistance from Netronics Customer Support.

- Dismiss the command line session.
- Double click the Link Manager icon on the desktop, or click Start | Programs | Link Manager | Link Manager.

The Log-on dialog box appears.

Figure 5-3: First time log-on window

The Link Manager log-on Concept

NetStream supports SNMPv1 and SNMPv3 either separately or together. The log-on procedure differs slightly between operation under SNMPv1 and SNMPv3. In what follows below, we assume that SNMPv1 is in use. In Table 5-2 below, we show the difference between SNMPv1 and SNMPv3 at log-on time.

The Link Manager provides three levels of access in one of two entry modes. To see them, click Options at any time in the Log on window (Figure 5-3 above). You are offered an extended log-on window:

Link Manager Version 9.5.20 (Build 9496)						
IP Address:	Local Connection 🔻					
Password:						
User Type:	Installer 🔻					
SNMPv1 Com	munities / SNMPv3 passwords					
Read-Only:	•••••					
Read-Write:	•••••					
SNMP	v3 Trap Authentication					
User:						
Password:						
Connect th	Connect through Server					
IP Address:						
OK Cancel Options <<						

Figure 5-4: Extended log-on window

At the User Type field, click the list button:

Link Manager Version 9.5.20 (Build 9496)							
IP Address:	Local Connection						
Password:							
User Type:	Installer 🔹						
SNMPv1 Comn	Operator s						
Read-Only:	Installer						
Read-Write:	Observer						
SNMPv	3 Trap Authentication						
User:							
Password:							
Connect thr	Connect through Server						
IP Address:							
OK Cancel Options <<							

Figure 5-5: Log on window exposing the user types.

There are three user types:

- An **Observer** has read-only access to the link. An Observer can monitor the link, generate reports, but may not change any link parameters.
- An *Operator* can install and configure the link.
- An *Installer* can, in addition to functioning as an Operator, also change the operating band. The latter function has legal ramifications, requiring familiarity with local regulations.

If you are using Trap Authentication, enter the User and Password. Leaving these fields blank or incorrect, will not prevent you from logging on. You will not be able to see trap messages directed to the trap message address associated with a defined user. The allocation and association of a trap address with a user is described in **Chapter 9**, **Site Management: IP Address, VLAN and Protocol.**

The following table summarizes these options:

Table 5-2: L	Jser types,	default p	passwords	and	function
--------------	-------------	-----------	-----------	-----	----------

User Type Default Password	Default	Function	SNMPv1		SNMPv3		
	Password	Function	Community	Community String	Password	Default Value	
Observer	admin	Monitoring	Read-Only	public	Read-Only	public	
Operator	admin	Installation, configuration	Read-Write	netman	Read-Write	netman	
Installer	wireless	Operator plus set-band	Read-Write	netman	Read-Write	netman	

The Network Manager should change the default passwords as soon as possible, particularly if SNMPv3 is to be used.

> Continuing the log-on procedure:

- 5. Type an IP address for the ODU (if you connect through a LAN), or click Local Connection (if you are connected directly to the IDU port).
 - The Local Connection method uses broadcast packets to "discover" the attached ODU
 - If you log on using Local Connection, but your physical connection is not local (i.e. anything other than a direct connection between the managing computer and the IDU), then any configuration you carry out may affect other links in the network. Do not do this!
 - Do **not** carry out this procedure using a multi homed managing computer also connected to a network. It will flood the network with broadcast packets. Further, it will throw any other links on the net-work into Installation or Inactive mode.

- In any event, as a precaution, default log-on over Local Connection is readonly mode. Check the Read/Write enable box to carry out installation procedures.
- Network log on (IP address to the ODU) is recommended.
- If you log on via an over-the-air IP address, you will receive a warning. If you reset the site to which you are connected to factory settings, you can lock yourself out of the link.

- The default IP address for the ODU is 10.0.0.120. The subnet mask is 255.0.0.0.
- The actual IP address is defined during link configuration (see Site Management: IP Address, VLAN and Protocol on page 137. See also, Chapter 25).
- 6. If your User Type is not Operator, then choose it now.
- 7. Enter the password.
- 8. If you are a user with Read-Write permission, click **Options** to enter the Community options if required
- 9. For initial log on:
 - Leave the default Community passwords, *netman* for read-write, and *public* for read-only.
 - If Community values were previously defined, enter them under Community in the Read-Only or Read-Write boxes.
 - If you are a user with read-only permission, then you may only log on as Observer.

The Link Manager main window is displayed (see Figure 5-10).

Log-on Errors and Cautions

Unsupported Device

Attempting to connect to an unsupported device on an otherwise valid IP address (for example, a LAN printer) will result in the following error message:

Figure 5-6: Unsupported device message

Incorrect IP Address or Invalid Read/Write Community Strings

If the IP address chosen is invalid, the community strings are incorrect or the link is unreachable, the following error message will be displayed:

Login	۲
Device unreachable!	
Please check: - IP Address was entered correctly - Ping connection to the device - Read-Only Community string setting in the login dialog	
Forgotten community string can be retrieved from product label or Technica	I Support.

Figure 5-7: Unreachable device message

> To deal with lost or forgotten Community Strings:

1. Send an email request for to Netronics Customer Support for an alternative key. Your email must include the ODU serial number shown on the adhesive sticker on rear of one of your ODUs.

2. The reply will contain an alternative key, which functions as a temporary master Community String. Copy/paste the supplied alternative key to both the Read-Only and Read-Write fields in the log-on window (Figure 5-4). This gets you to the Link Manager main window.

3. Use the procedure on page 144 to enter new Community Strings.

Incorrect Password

If you type an incorrect password in the Login window, the following message will be displayed:

Figure 5-8: Invalid password message

Logging in to the Over-the-Air Site

You can log on to the over-the-air site of an established link (Site B in our example). However, you will be first offered the following caution:

Over the air connection - 192.168.1.102
The system has detected an over the air connection to the device. Please select one of the following: Continue - to resume this operation. Read Only - to connect in Read Only mode. Switch - to connect to the local device, instead of the remote one. Cancel - to abort this operation.
In the future, do not show this warning.
Continue Read Only Switch Cancel

Figure 5-9: Logging on to an over-the-air site

If you upgraded from an 8.x .xx release of the Link Manager, you will notice that it is no longer possible to work in "Offline mode". You can only enter the Manager when it is connected to a valid NetStream device.

Changing the Log-On Password

To change the log on password:

- 1. Log on to a valid IP address.
- 2. From the **Tools** menu, select **Change Password**.

The Change Password dialog box appears.

3. Enter the current password, and the new password.

A valid log-on password must contain at least five characters excluding SPACE, TAB, and any of ">#@|*?;."

4. Click **OK** to confirm.

Default NetStream Settings

The default settings of the NetStream configuration parameters are listed in the second column of Table 5-3 below. The third column shows the values we use in this manual for illustrative purposes.

Table 5-3: Default ar	d Illustrative Settings
-----------------------	-------------------------

Parameter	Default Value	Illustrative Value			
Factory default band	Product dependent	5.820 GHz			
ODU IP Address	10.0.0.120	10.104.2.2 and 4			
Subnet Mask	255.0.0.0	255.255.0.0			
Default Gateway	0.0.0.0	10.104.10.21			
Trap destination	0.0.0.0	0.0.0.0			
Link Manager log-on passwords

At this point the main window of the Link Manager should be displayed:

Figure 5-10: Opening Link Manager window prior to installation – Using IDU-NetStream RMs

The Dynamic Tx Ratio bar only appears for model NetStream 5x200

A detailed field by field description of the contents of the Link Manager main window may be found in **Chapter 7**.

The procedure required to make the link functional has three phases:

1. Link Installation - which we will detail below.

Installation actually gets the link operational by setting the link parameters. It uses a fixed channel at the lowest possible modulation, BPSK at 6.5 Mbps and will work under the harsh interference condition.

During the installation procedure, the definition of link-wide parameters is automatically applied to both sides of the link.

The ODUs as supplied by Netronics are set up with a factory default band. If for some reason the default band needs to be changed, it should be done before link Installation. The procedure is set out in **Chapter 22**. Use of an incorrect band may be in violation of local regulations

2. Link Configuration - described in Chapter 8.

Configuration provides much the same functionality as Installation, but for a running link. A fallback to Installation mode is provided for situations which cannot be handled without resetting the link, such as antenna realignment and IDU or ODU replacement.

The Link Installation and Configuration phases are both carried out with Wizards, which "walk you through" the processes. The Wizards are visually quite similar and will be described in detail below.

3. Site Configuration - described in Chapter 9.

Site specific configuration for each side of the link is available at any time - under a running link or under the restricted Installation mode.

Site Configuration consists of a set of panels, which may be invoked individually in any order, as needed.

An installed and configured link can be returned to installation mode for reinstallation and configuration from last settings or from factory settings.

- Reversion to installation mode requires a complete break in the link service
- Configuration mode may vary the service throughput and quality, but without a service break

Using Link Manager Spectrum View

Prior to running the Installation Wizard (Chapter 6), consider running Link Manager Spectrum View utility.

The Link Manager Spectrum View utility is an RF survey tool designed to support the link installation prior to full link service activation. The tool provides comprehensive and clear information enabling easier, faster and better quality installations.

To launch Spectrum View, go to the main window menu (Figure 5-11) and click **Tools |Spectrum** View. A display similar to the following appears:

Figure 5-11: Spectrum View - Opening Display on installed link

The top pair of analysese relate to the managed site; the bottom pair relate to the remote site. See **Chapter 27** for detailed information about operating Spectrum View and understanding the displayed statistics.

Chapter 6

Installing the link

Overview

The installation is carried out using the Installation wizard. Its operation is detailed in the following pages in a tutorial style.

For the purpose of explanation, we will set up a laboratory link with the following characteristics:

- Channel selection: Automatic
- Antennas: Dual at both sites
- **Services:** Ethernet + 7xE1 on ports 1, 2, 3, 8, 10, 11, 14. It is unlikely that you would use a non-contiguous set of ports but this shows that if required, it can be done.

The Installation wizard has steps as shown in Table 6-1 below.

Table 6-1: Link Installation Wizard

Installation

Step 1, Start the Wizard

In the tool bar of the Link Manager main window, click the **Link Installation** button. The Link Installation button is only accessible if the antennas are properly aligned. If this box is "grayed out", you should align the antennas as set out in **Chapter 4**.

The Installation Wizard opens:

Link Installation Wizard		
	Welcome to the L Wizard	ink Installation
	This wizard is used for perform	ing Link configuration updates.
	After Changes made in Frequer resynchronized.	ncy field the Link will be
	Note that all changes made to the Link Quality monitor.	the Link should be reflected in
	All the fields are mandatory.	
	< Back	Next > Cancel
Monitor Link		۲
Radio Interface	Location	Location
RSS [dBm]	-33	-34
Quality	No Serv Ethernet Ethernet + TDM	No Serv Ethernet Ethernet + TDM

Figure 6-1: Link Installation Wizard

The bottom data area reproduces the corresponding data from the main window - which the above panel obscures. See Chapter 7 for a field by field description of this data area.

Click Next to proceed with the installation procedure.

Step 2, System Parameters

The system dialog box opens:

Link Installation Wizard		
System Fill in the attribute field	s below.	
Link ID		Δ
Link Name	Link	
Site 1	Location	
Site2	Location	
Link Password	•••••	Change
	< Back	Next > Cancel
Monitor Link		۲
Radio Interface	Location	Location
RSS [dBm]	-33	-34
Quality	No Serv Ethernet Ethernet + TDM	No Serv Ethernet Ethernet + TDM

Figure 6-2: Installation Wizard, System dialog box

To complete Installation Step 2:

- 1. Enter a Link ID. The Link ID must be identical for both ODUs in the link, otherwise they will not communicate. The Link ID must include at least eight alphanumeric characters. Up to 24 characters are allowed. You should use a Link ID composed of both alphabetic and numeric characters.
- 2. Enter a Link Name for the link identification. The default name is "Link". You should change it.

3. Enter names for Site 1 and Site 2. The default names are both "Location". You should change them. Throughout this manual, we use A for Site 1 and B for Site 2.

4. Optionally enter a new Link Password.

If the Link Password is incorrect a link is established but configuration cannot be performed and no services are available. A new link password may be obtained from Netronics Customer Support or use the alternative password supplied with the product.

The link password is peculiar to the link itself and should not be confused with the Link Manager log on password.

Here is our completed System panel:

Link Installation Wizard					
System Fill in the attribute fields	s below.				
Link ID	EBG_20561334	▲			
Link Name	TPSF_BTT

RSS [dBm]	-33	-33			
Quality	No Serv Ethernet Ethernet + TDM	No Serv Ethernet Ethernet + TDM			

Figure 6-3: Installation Wizard, System dialog box filled out

5. Click Next.

The default link with a rate of 6.5 Mbps is evaluated.

The Channel Setting dialog box appears. Proceed to Channel Settings, below.

Changing the Link Password

The default password is *wireless-bridge*. Optionally, you can change the link password as explained here.

> To change the link password:

1. Click the Change button in the System dialog box.

The Change Link Password dialog box opens.

Use the Hide characters check box for maximum security

🔒 Change Link F	Password
Enter curr	ent Link Password:
•	
New:	
Confirm:	
	Hide characters
Forgot Link	Password? OK Cancel

Figure 6-4: Change Link Password dialog box

2. Enter the current link password (The default link password for a new ODU is *wireless-bridge*).

If you have forgotten the Link Password, click the Forgotten Link Password button. The following window is displayed:

Alternative Link Password
Alternative Link Password
The Alternative Link Password is supplied with the product. It may also be obtained via Customer Support. Please have the unit's Serial Number and/or MAC Address ready when requesting an Alternative Link Password.
Enter the Alternative Link Password:
Θ.
OK Cancel

Figure 6-5: Lost or forgotten Link Password recovery

Follow the instructions to use the Alternative Link Password, and click **OK** to finish. You are returned to the window in Figure 6-4 above. Continue with the next step.

- 3. Enter a new password.
- 4. Retype the new password in the Confirm field.
- 5. Click **OK**.
- 6. Click Yes when asked if you want to change the link password.

- 7. Click **OK** at the *Password changed* success message.
 - A link password must contain at least eight but no more than 16 characters excluding SPACE, TAB, and any of ">#@|*?;."
 - Restoring Factory Defaults returns the Link Password to *wireless-bridge*.
 - If the link is inactive, then the link password may also be changed from the Site Configuration dialogs. See page 144.

Step 3, Channel Settings

NetStream systems have a feature called Automatic Channel Selection (ACS). In the event of sync loss, ACS chooses the first available channel in a list of monitored channels nominated in the Channel settings window of Figure 6-6 below. A channel switch takes place sufficiently fast as to ensure no loss of service.

Link Installation Wizard				
Channel Settings Any changes to the Cha	nnel field may re	sult in a Link re-	-synchronization.	
Installation Channel [GH	z] 5.820			
Channel Bandwidth [MHz	20	•		
Automatic Channel Se Available Channels List [GH:	election]			
▼ 5.735 ▼ 5.750 ▼ 5.740 ▼ 5.755 ▼ 5.745 ▼ 5.760	 ✓ 5.765 ✓ 5.770 ✓ 5.775 	 ✓ 5.780 ✓ 5.785 ✓ 5.790 	 ✓ 5.795 ✓ 5.800 ✓ 5.805 	 ✓ 5.810 ✓ 5.815 ✓ 5.820

RSS	[dBm]		-33			-33	}
Qua	ality	No Serv	Ethernet	Ethernet + TDM	No Serv	Ethernet	Ethernet + TDM

Figure 6-10: Transmission Power and Antenna Parameters

The choice of Tx Power, antenna gain and cable loss (between the radio and the antenna) determines the EIRP and is affected by such considerations as radio limitations and regulatory restrictions.

Before proceeding to antenna installation details, the background information in Appendix F, Setting Antenna Parameters should be considered.

To set Tx Power and configure antennas:

1. Click the Configure buttons in turn to configure the antennas on both sides of the link. Each one offers a dialog like this:

🙄 Tx Power and Antenna configuration	- A	? X
Antenna Connection Type	ernal 🔘 Integrat	ed
Antenna Type	Please select	-
 RSS in both antennas is similar antenna is the right selection 	ilar. Dual polariza n.	ation
Required Tx Power (per radio)	25 🌲	[dBm]
Tx Power (per radio)	25	[dBm]
Tx Power (system)	28	[dBm]
	20	
Antenna Gain	28.5	[dBi]
California	0.0	[Jp]
Cable Loss	0.0 -	[ab]
Max EIRP	56	[dBm]
EIRP	56.5	[dBm]
	ОК	Cancel

Figure 6-11: Antenna configuration dialog

2. Choose the antenna type and required transmission (Tx) power for the first site and click **OK**. You will receive the following warning:

Figure 6-12: Antenna type change warning

For NetStream 5x50 Links:

These ODUs may be switched between the SFF embedded antenna and external antennas. To this end, the Antenna Connection Type radio buttons are always enabled:

Antenna Connection Type	💿 External 🛛 🔿 Integrated
Antenna Type	Dual 💌

Use the Integrated radio button to enable the embedded antenna.

Antenna Connection Type	🔘 External (Integrated
Antenna Type	Dual	~

Observe that the SFF embedded antenna functions as a dual antenna and cannot be changed.

- 3. Repeat the process for the second site.
- 4. At the same time you can set the Antenna Gain and Cable Loss.

The Tx Power (per radio) indicates the power of each radio inside the ODU and is used for Link Budget Calculations. The Tx Power (System) shows the total transmission power of the ODU and is used to calculate the EIRP according to regulations.

To see the relationship between Tx Power (radio) and Tx Power (system), note that $dBm=10 \times \log_{10} milliWatt$ so that if you double the power in

milli Watts (for two radios) then dBm will increase by 10 $log_{10}2 \approx 3$.

If you choose to set the Antenna Gain and Cable Loss, you will receive the following warning message:

Tx Power a	nd Antenna configuration - A
0	You are about to change the following parameters: - Antenna Gain or Cable Loss, this may affect other parameters: Tx Power, EIRP and Max EIRP Do you want to proceed with the operation?
	Yes No

Figure 6-13: Antenna parameters change warning

- The Max EIRP level will be automatically set according to the selected band and regulation.
- The EIRP level is the sum of the System Tx Power and the Antenna Gain minus the Cable Loss.

If inequality (*) above is violated, then the following warning window is displayed:

R Power Limits	the Tx Power limits are:		
Single Anter	nna Configuration	Dual Antenn	a Configuration
Rate [Mbps]	Max Tx Power [dBm]	Rate [Mbps]	Max Tx Power [dBm]
26	24	52	24
39	21	78	21
52	19	104	19
58.5	18	117	18
65	18	130	18
			Close

Figure 6-14: Tx Power Limits

The precise relationship between the items in inequality (*) and the window of Figure 6-11 is as follows:

- Required Tx Power (per radio) will be adjusted down to the lesser of the value entered and maxAvailableTxPower
- Tx Power (system) is maxAvailableTxPower + 3 (for 2 radios)
- Max EIRP is maxRegEIRP.
- EIRP is maxAvailableTx Power + Antenna Gain Cable Loss

The table in Figure 6-14 only shows rates where the maximum Tx Power is the limitation, rather than regulations. When you close the window of Figure 6-14, the change you requested will **not** be honored, and you will need to try again.

Since our demonstration link is entirely indoors, we have reduced Tx Power to 5 dBm to obtain a realistic RSS. Although this is much too low for field use, the method is general.

Link Installation Wizard								
Tx Power and Antenna parameters Fill the Tx Power and Antenna fields of local and remote sites.								
		A	В					
Antenna Type		Dual	Dual					
Antenna Gain [dBi]		28.5	28.5	i .

Quality	No Serv Ethern	et Ethernet + TDM	No Serv Etherne	t Ethernet + TDM				

Figure 6-15: Antennas configured for two dual and Tx power 5 dBm

5. Choose Dual Antenna mode if appropriate. The green Antenna Configuration diagram indicates the active state. For dual antennas in Diversity mode it looks like this:

There are intermediate modes available for dual antennas opposite a single antenna as set out on Figure 6-10 above.

If you make a change you will see a warning similar to this:

Link Installa	ation Wizard
A	You are about to change Dual Antenna mode. Changing to Diversity causes the link to transmit the same information on both antennas. This will cause a link re-synchronization. Air quality might be affected. Do you want to continue?
	Yes No

A similarly worded warning applies to a s switch from MIMO to Diversity mode

6. When you are finished with Tx Power configuration, Click Next.

Step 5, Hub Site Synchronization Settings

Link Installation Wizard							
Hub Site Synchroniz Settings for reduc Site.	ation Settings ing mutual interference between	multiple units at the Hub					
Status	A	В

RSS [dBm	1	-	54			-5	54		

Figure 6-17: Services and Rates – NetStream 5x200 only

Figure 6-18: Services and Rates for models NetStream collocated as a client

For a collocated link proceed to TDM Services selection.

Otherwise, you can use the green slider to allocate asymmetric Ethernet capacity by changing the Transmission Ratio between the sites.

For example: Suppose that during congestion, you might want to use 70% for the downlink and 30% for the uplink. Your choice would typically be based on your experienced traffic load during periods of congestion.

For a collocated link you will see a display like this:

If you choose a Transmission ratio outside the two tick marks, you run the risk of disabling collocated links operating on a lower channel bandwidth:

Whatever the case, if you change the Transmission Ratio on a collocated link, you will be offered the following warning:

The conditions under this may occur are detailed below.

If you have active collocated links, or if you are uncertain of whether collocated links provide TDM services do not use this option now. You can do it at a less disruptive time using the Link Configuration (Chapter 8).

Otherwise, click Yes to continue.

Limitations on the use of Asymmetric Allocation

For non collocated links, capacity allocation between uplink and downlink traffic is determined automatically according to actual Ethernet traffic and air interface conditions. Your manual allocation using this feature "cuts in" during congestion.

Asymmetric Allocation and Collocation

The use of Asymmetric Allocation is limited where the link is collocated. You may only change the HSM (master) from symmetric to asymmetries allocation. If you do this, the affects on collocated clients are as follows:

- Releases prior to 2.4 Link down
- Release 2.4 and later (NetStream 5x200) TDM services stopped, link set to transmission ratio of master
- Release 2.4 and later (NetStream 5x200) Asymmetric Allocation slider visible but cannot be changed

The last two items also apply to collocated links using EHSS.

The behavior of a collocated NetAstra base station, is very similar to that of a NetStream radio. There will be slight differences between the Transmission Ratio of a regular NetStream radio and a NetAstra base station.

Services and Rates

The Services and Rates dialog as shown in **Figure 6-17** will be different:

Link I	nstallatio	n Wizard							
Services Select the Services and Rate from the lists below.									
	Service	TDM Jitter Buffer Services Rate [Mbps] Distance	er Hot Standby Ring Ethernet QoS Ethernet Configure Adaptive • 0 Km / 0 Miles						
	Tran	A 0	B 100% 50.0% / 50.0%						

Figure 6-19: Services and Rates - NetStream master, NetStream clients

The areas outside the tick marks should be avoided. Using those areas, you may loose the collocated link with the longest distance between sites.

TDM Services selection

Fo select services:

1. Click the **Configure** button. The TDM services dialog is displayed:

Services Configuration	-	? ×
TDM Type		
) E1	© T1	
-TDM Ports		
1 3 5	7 9 11	13 15

Figure 6-23: Services and Rates dialog: Available rates

> To choose a modulation rate:

- 1. Choose Adaptive or one of the available rates.
- 2. Click **Evaluate** to continue or click the TDM Jitter Buffer tab to set the TDM Jitter Buffer (see next section).

The service is activated as show below:

Link I	ink Installation Wizard Services Select the Services and Rate from the lists below.							
	Service TDM Jitter Buffer Hot Standby Ring Ethernet QoS							
		Services Rate [Mbps] Distance	7xE1+ Ethernet 104 0 Km / 0 Miles	:		Configure		
	🗸 Serv	ice has been evalu	iated. Click Nex	t to con	tinue.	Evaluate		

You are returned to the Services and rates dialog of Figure 6-23.

Setting Monitored Hot Standby Mode

If you are not using Hot Standby Mode, you may skip this section.

To install and use the Hot Standby feature, see Chapter 15. The following procedure can be used to switch links between primary and secondary or to disable the mode.

To set the Hot Standby Mode:

1. Click the Hot Standby tab. The following dialog appears:

Link Installation) Wizard	
Services Select	he Services and Rate from the lists below.	
Service	TDM Jitter Buffer Hot Standby Ring Ethernet QoS	
	Mode: O Primary O Secondary O Disabled	
		Evaluate

Figure 6-25: Choosing Hot Standby Mode

2. Click the radio button to make this link primary or secondary.

Ethernet Ring

To install and use the Ethernet Ring feature, see Chapter 16.

Ethernet QoS

To install and use the Ethernet QoS feature, see Chapter 20.

Setting the TDM Jitter Buffer

To set the TDM Jitter Buffer size:

1. Click the TDM Jitter Buffer tab. The following dialog appears:

Service TDM Jitter Buffer Hot Standby Ring Etherne	
Service TDM Jitter Buffer Hot Standby Ring Etherne	
	t QoS
A Size [ms]: 5.2 🚖 Default Size [ms]: 9	i.2 🔹 Default

Figure 6-26: TDM Jitter Buffer Configuration

• The receiver jitter buffer for each site can be enlarged, thereby increasing system resistance to interference (the

larger the jitter buffer, the longer the interference period that the system will overcome without TDM errors).

- You can also decrease the jitter buffer to decrease the system delay.
- The jitter buffer can be configured between 2.0 and 16.0 ms.
- After setting the new value you must evaluate the expected quality. During the evaluation the TBFR (TDM Block Failure Ratio) bar is displayed. You select either **Next**, which performs the change or **Back** to cancel the change. Notice that the Jitter Buffer is configured per site.

Link Installation Wizard								
Services Select the Services and Rate from the lists below.

Figure 6-30: TDM Parameters Configuration (2)

3. Click the required parameter. Their meanings are as follows:

Please keep in mind that what follows is *per port*.

	Transparent - Transparent
3 *	Loop Timed - Recovered
<u>_</u>	Recovered - Loop Timed
a t	Internal - Recovered
<u></u>	Recovered - Internal

Figure 6-31: TDM Parameters

Transparent/Transparent

The clock at Site A regenerates the clock from Site B and vice versa.

Loop time/Recover

The Site A port receive clock is used as the transmit clock for that port on both sides of the link.

Recover/Loop time

The Site B port receive clock is used as the transmit clock for that port on both sides of the link.

Internal/Recover

The Site A port uses its internal oscillator to generate its transmit clock while the Site B port regenerates the clock received at the Site A port.

Recover/Internal

The Site B port uses its internal oscillator to generate its transmit clock while the Site A port regenerates the clock received at the Site B port.

Mousing-over any port causes a pop-up help ballon:

4. You may configure the E1 ports to unbalanced mode (75 ohm). You should configure both sides of the link as balanced or unbalanced.

Figure 6-32 shows an adapter cable for connecting devices with balanced E1 interface to the user equipment with unbalanced E1 interface. The Y splitter cable includes one RJ-45 balanced connector (left) and two unbalances BNC coaxial connectors (right).

5. Click Finish to complete the wizard.

Using T1 TDM Ports

Link Installation Wizard								
TDM Parameters Configure the TDM Parameters below.

> To verify the installation:

• Verify that the Received Signal Strength (RSS) is according to expected results as determined by the Link Budget Calculator.

Installation mode, as described above, may be re-entered using **Site:A** or **Site:B** and **Installation Mode** in the Site Configuration dialog. Some Installation mode functionality may cause a break in, or degrade link service.

If you can accomplish link changes without affecting the service, always prefer to use Configuration mode, described in Chapter 8.

The Link Manager: Main Window

The Main Window of the Link Manager

Ensure that the Link Manager is running.

The main window should look similar to that in Figure 7-1:

Figure 7-1: Main window, Wireless Link is Active

The main window of the Link Manager contains a large amount of information about the link. Before proceeding to details of link configuration we set out the meaning of each item in the main window.
The Link Manager Toolbar

In configuration mode, the Link Manager toolbar contains the following buttons:

الله (Link Configuration	X Link Installation	🏷 Installation Mode	ی) Site: A	🧏 Site: B	Get Diagnostics	🥔 Clear Counters	K Log Off	🥑 Help(F1)

In Installation mode, Link Configuration is grayed out and Link Installation is open. The button functions are set out in Table 7-1:

Item	Description
Link Configuration	Changes configuration parameters of an operating wireless link; assigns text files for storing alarms, statistics and configuration data. This button is disabled until a link installation has been completed
Link Installation	Performs preliminary configuration of the system. This button is disabled after the link is installed
Installation Mode	Enter Quick Installation mode. See Chapter 23.

Elements of the Link Manager Main Window

Link details pane

The Link details pane on the left is split into three sections, which are largely self explanatory. The top section summarizes information about the link:

For Link status possibilities and color codes, see Table 10-2.

The two lower left panels show basic link site details:

The three fields for each site are user definable. See page 137.

The Monitor pane

The monitor pane, is the main source of real time information about link performance at both link sites. It includes the following panes (top to bottom):

Received Signal Strength

Radio Interface, Received Signal Strength (RSS) in dBm and Transmission Ratio:

Under normal operating conditions the RSS for both sites should be balanced with occasional fluctuations of 1-2 dBM. The main causes of consistent imbalance are as follows:

- A consistent RSS imbalance may be caused by different TX Power settings at each site. There is no warning indicator but it may be easily corrected using **Site Configuration | Tx Power & Ant** or by rerunning the Configuration wizard.
- A yellow warning triangle will be displayed for an RSS difference of more than 8 dBm between the two polarizations on the same site (the RSS display is the combination of both polarizations on this site)

Location:	Local_C	Remote_C	
Radio Interface:			
RSS [dBm]	-67	-70	A
Dynamic Tx Ratio [%]	50.0 I)/50.0	55 Balance
		RSS in	radio 1 is lower than in radio 2. Check Installation!

Notice the mouse-over tool-tip explaining the problem.

• A red warning triangle indicates an RSS difference of more than 16 dBm between the two polarizations on the same site

Location:	Local_C		Remote_C	
Radio Interface:				
RSS [dBm]	-74	<u>^</u>	-76	▲
Dynamic Tx Ratio [%]	0	50.0/50.0	😵 R55 Balance	
			RSS in radio 1 is significar	antly lower than in radio 2. Check installation!

Again, notice the mouse-over tool-tip explaining the problem.

The latter two cases are usually the result of a physical problem at the indicated site. Probable causes are:

- Interference
- Antenna polarity problem
- ODU malfunction

The Dynamic Tx Ratio bar only appears for model NetStream 5x200.

Ethernet Service

Ethernet Service:		Rx/Tx Rate Units: 💿 Mbps 💿 Fps
Ethernet Throughput [Mbps]	25.6	25.7 0 26.2
Rx Rate	0.5	25.6
Tx Rate	25.6	0.5

• Estimated Ethernet Throughput: The numbers are the current calculated throughputs at each site. The colored bars (with numbers) indicate the maximum possible throughput having regard for air conditions.

- Rx and Tx Rates: The Rx and Tx rates are the receive and transmit rates **on the LAN side** of each ODU, not the air side. For a balanced link, the Rx and Tx rates at the LAN side of Site A will match the Tx and Rx rates at the LAN side of Site B respectively. In all cases, The LAN side Rx rate shown will be the same as the air side Tx rate for each individual ODU.
- Actual Ethernet traffic received and transmitted rates per site, is in Mbps of Fps, selectable in the panel title bar.

TDM Services (IDU-NetStream RM and IDU-NetStream DT)

TDM Service:						Co		rs Dis	play N		0	Accur	nulat	ive (O Cu	rrent
TDM Block Failure Ratio	< 4.1 X 10E-7					< 4.1 X 10E-7										
Error [Blocks]				1	0) ()			
	1	3	5	7	9	11	13	15	1	3	5	7	9	11	13	15
F1 Ports	1	\mathbf{Y}				\checkmark			\checkmark	\sim				~		
	✓.			V	V		S		V			V	N		V	
	2	4	6	8	10	12	14	16	2	4	6	8	10	12	14	16

- The title bar enables you to switch between Accumulative and Current view.
- Immediately below the title bar is displayed the TDM Block Failure Ratio. It is zeroed by the **Clear Counters** button in the tool bar.
- Error block count is shown immediately above the active TDM channels display.
- The color of the TDM ports reflects their current status:
 - Green Operational
 - Red Error: LOS for loss of signal and AIS for Alarm Indication Signal
 - Yellow Loopback
 - Gray Inactive

Frequency box

Frequency: 5.820 GHz

The Frequency box shows the link frequency. The color of the box indicates the status as follows:

- Green is an active link
- Red is an inactive link
- Magenta indicates an authentication or compatibility problem
- Brown indicates severe compatibility problem

Events Log

The Events Log, stores alarms generated from both sides of the link and is detailed in Chapter 10.

Number	Date & Time	Message	△ Trap Source	IP Add
000001	14/02/2013 3:34:46 PM	Connected to A.	Internal	
000002	17/02/2013 10:06:52	TDM Counters were cleared for both sides	Internal	
•		m		

The little triangular arrow-head on the right of the Message header indicates the order of messages. Default as shown, is from oldest to newest. Click it to change the order.

Status Bar

12

Rescue Alarm		In the event of an active alarm, opens alarms dialog	

Chapter 8

Configuring the link

Overview

This chapter describes the link configuration procedure, which is performed after the installation of both sides of the NetStream link, as set out in **Chapter 6**.

Link configuration uses a Link Configuration wizard to redefine the configuration parameters and fine-tune an operational link. Both sides of the link are configured simultaneously.

Link configuration allows you to configure link parameters, which do not lead to sync-loss or require a reset. Some may change service performance, in respect of which, warnings are displayed.

For ease of use, the Link Configuration wizard follows the same pattern as Link Installation. You should therefore be familiar with the content of Chapter 6.

The following parameters are configured using the Link Configuration Wizard:

- System parameters
- Channel settings
- Transmission power and antenna settings
- Service parameters

The Configuration Wizard has seven steps as shown in Table 8-1 below.

Table 8-1: Link Configuration Wizard

Configuration

Since configuration functionality is included in the installation, we will briefly review the main steps and for most part offer references to the corresponding installation step.

Step 1, Start the Wizard

In the tool bar of the Link Manager main window, click the **Link Configuration** button. The Link Configuration button is only accessible on a fully installed link as set out in Chapter 6.

The Configuration Wizard opens:

Figure 8-1: Link Configuration Wizard

Click **Next** to proceed with the configuration procedure.

Step 2, System Parameters

The System dialog box opens:

Link Configuration Wizard	_	
System Fill in the attribute fields	below.	
Link ID	EBG_20561334	
Link Name	TPSF_BTT	
Site 1	A	
Site2	В	
Link Password	••••	Change
	< Back	Next > Cancel
Monitor Link		۲
Radio Interface	А	В
RSS [dBm]	-54	-55

Figure 8-2: Configuration Wizard, System dialog box

The System attributes may be edited and the Link Password may be changed exactly as in the corresponding Link Installation step on page 79.

Click Next to continue.

Step 3, Channel Settings

Configuring the Channel Settings follows the same pattern as the Installation procedure:

Link Configuration Wizard			
Channel Settings Any changes to the Cha	nnel field may result in a	Link re-synchroniza	ation.
Operating Channel [GHz]	5.820	v	
Channel Bandwidth [MHz]	20	•	
Automatic Channel Se Available Channels List [GHz	lection]

If you click the Operating Channel drop-down list, the following window appears:

Link Configuration Wizard		
Channel Settings Any changes to the Cha	nnel field may result in a Link re-	-synchronization.
Operating Channel [GHz] Channel Bandwidth [MHz	I 5.820 - I 20 - S electic 10 20 40	
	< Back	Next > Cancel
Monitor Link		۲
Radio Interface	A	В
RSS [dBm]	-54	-55

Figure 8-6: Channel frequency options

Selecting one of the frequencies presented returns you to the status of Figure 8-5 with the appropriate change. If you choose **Other...**, the following window opens:

Link Configuration Wizard			
Channel Settings Any changes to the Cha	nnel field may result in a Link re-	synchronization.	
Operating Channel [GHz] Channel Bandwidth [MHz]	Other I 20 election	5.820	
	< Back	Next > Ca	incel
Monitor Link			۲
Radio Interface	A	В	
RSS [dBm]	-55	-55	

Figure 8-7: Choosing an "Other" Operating Channel frequency

The right hand drop-down list (showing the current Operating Channel) allows you to fine-tune the frequency in increments of ± 5 MHz within a range of the operating band, which in this example is 5.725 - 5.850 GHz.

The Channel Bandwidth may also be changed. The available choices are 5, 10, 20 and 40 MHz depending on model and regulation (see Appendix A).

For the purposes of this illustration, we choose adaptive channel selection and operating channel frequency 5.820 GHz.

When you have completed making your choice, click **Next** to continue.

Step 4, Tx Power and Antenna Settings

The Tx Power and Antenna Settings window is similar to that for Installation:

Link Configuration Wizard			
Tx Power and Antenna pa Fill the Tx Power and Ar	arameters itenna field	s of local and remote s	sites.
		A	В
Antenna Type		Dual	Dual
Antenna Gain [dBi]		28.5	28.5
Tx Power (per radio)	[dBm]	5	5
Tx Power (system) [dBm]	8	8
EIRP [dBm]		36.5	36.5
		Configure	Configure
Dual Antenna Mode	sity	Antenna Configuratio)))) [
		< Back	Next > Cancel
Monitor Link			۲
Radio Interface		А	В
RSS [dBm]		-54	-55

Figure 8-8: Transmission Power and Antenna Parameters

As in Installation mode, you need to consider three items:

- Number of antennas at each Link site (1 or 2)
- Tx Power setting for each one
- MIMO or Diversity mode

Changing Number of Antennas and Tx Power

TX Power, Antenna Gain and Cable Loss

If you chose to configure either antenna, you are presented with the following window:

Step 4, Tx Power and Antenna Settings

J Tx Power and Antenna configuratio	n - A
Antenna Connection Type 🛛 🔘 Ex	ternal 🔘 Integrated
Antenna Type	Dual 🔻
Required Tx Power (per radio)	5 🊖 [dBm]
Tx Power (per radio)	5 [dBm]
Tx Power (system)	8 [dBm]
Antenna Gain	28.5 🚖 [dBi]
Cable Loss	0.0 🚔 [dB]
Max EIRP	56 [dBm]
EIRP	36.5 [dBm]
	OK Cancel

Figure 8-9: Antenna configuration dialog with opened type selection

(Recall that we are using an unrealistically low Tx power here because our link in a laboratory.)

So far, the procedure duplicates the corresponding Installation process. If you choose a different antenna type and click **OK**, you will receive the following cautionary message:

You may also change the Required Tx Power, Antenna Gain and Cable Loss. The procedure is the same as for the corresponding Installation, Step 4: Tx Power and Antenna Settings.

In this context, entering Installation mode causes a service break until it is restored by running the Installation wizard.

If you are uncertain, do not do this without expert technical assistance.

Switching Between Single and Dual Antennas

Single/Dual Antenna mode selection works precisely the same way as shown for Installation, Step 4:

For NetStream	m 5x50 Links:
---------------	---------------

These ODUs may be switched between the SFF embedded antenna and external antennas. To this end, the Antenna Connection Type radio buttons are always enabled:

Use the Integrated radio button to enable the embedded antenna

Antenna Connection Type	🔘 External	 Integrated
Antenna Type	Du	al 🗸 🗸

Observe that the SFF embedded antenna functions as a dual antenna and cannot be changed.

Switching Between MIMO and Diversity Modes

A similarly worded warning applies to a s switch from Diversity to MIMO mode.

Link Config	uration Wizard
	You are about to change Dual Antenna mode. Changing to Diversity causes the link to transmit the same information on both antennas. This will cause the system to enter into Installation mode. Air quality might be affected. Do you want to continue?
	Yes No

The considerations are otherwise no different from those set out in the corresponding Installation step.

When you have completed making your choice, proceed to the Services window.

Step 5, Hub Site Synchronization Settings

Link Configuration Wizard							
Hub Site Synchronization Settings Settings for reducing mutual interference between multiple units at the Hub Site.							
Synchronization Status							
Status	A	В					
Operation	Independent Unit	Independent Unit					
Serial Sync	N/A	N/A					
Serial Pulses	Not Detected	Not Detected					
Configure Operational States Enabled (These settings will apply to both sites) Expected Operational States Configure							
< Back Next > Cancel							
			w la				
Radio Interface	A	B					
RSS [dBm]	-52	-52					

Figure 8-10: HSS Settings

The Synchronization Status dialog box displays the current status of each side of the link. See Site Synchronization for instructions about installing and configuring collocated links. If you do not require HSS, click **Next**.

Step 6, Services

Here is the services dialog:

Link Configuration Wizard							
Services Select the Services and Rate from the lists below.							
Service	TDM Jitt	er Buffer	Hot Standby Ring E	thernet	: QoS		
	Service	s	7xE1+ Ethernet		Configure		
	Rate [M	bps]	Adaptive	•			
	Distanc	e	0 Km / 0 Miles				
					Ev	valuate]

< Back Next > Cancel							
Monitor Lin	k						۲
Radio Interfa	ace		А		В		
RSS [dBm	1		-54		-5	5	

Figure 8-11: Services and Rates dialog

To choose Services, see the corresponding Installation procedure in Chapter 6. If you are using a

link that -

- is non-collocated
- is Ethernet-only
- uses model NetStream 5x200 ODUs

then you may use Asymmetric Allocation. You may change the capacity allocation here the same way as during installation. In place of the IDU box in Figure 8-11, you will see the Asymmetric Allocation slider:

Transmission I A			в
0 💻		0	100%
	70.0%	7 30.0%	

The procedures for setting the Jitter Buffer and Hot Standby parameters are also the same as the corresponding procedures in Chapter 6.

Click Next to continue.

Step 7, TDM Clock Configuration

The following dialog is displayed:

Link Configuration Wizard							
TDM Parameters Configure the TDM Parameters below.							
TX Clock	7 9 11 13 15 11 11 11 15 11 11 11 11 11 11	Configure 👻 Select Maximum Deselect All

Figure 8-13: Configuration Wizard Exit Summary

Click **Done** to return to the main window.

The main window now reflects the configuration:

Figure 8-14: Main window of the manager after configuration

Chapter 9

Site Configuration

The Site Configuration dialog panels are used to configure parameters, which may differ between both sides of the link.

The parameters configured using the Site Configuration dialog panels include (among others):

- System settings
- Air interface Transmit (Tx) power and antenna
- Hub Site Synchronization status
- Network management including VLAN
- Inventory link hardware and software model details
- Security settings
- Date and time
- Ethernet service settings
- TDM Hot Standby status
- External alarms settings
- Operations Revert to factory settings

The Operations dialog offers a "doorway" to jump into installation mode.

The Site Configuration dialog has its own main menu with the following extra functionality:

- Backup ODU software
- Restore ODU software or configuration from a backup file
- Refresh the current panel
- Enable/disable the site ODU buzzer
- Jump back into installation mode keeping current configuration settings

Configuring the Site

Editing the Configuration Parameters by Site

You can edit the configuration parameters for each site individually. The following functions are available from the left side of the dialog box.

Site Configuration - A			×
File Actions Help			
Backup Resto	re Refresh	Buzzer Off	
😭 System	System		E C
Air Interface Tx Power & Ant	Description:	Wireless Link	
로 Hub Site Sync 🖺 Management	ObjectID:	1.3.6.1.4.1.29612.20.3.1.2	
 Inventory Security 	Name:	A	
Date & Time Advanced	Contact:	Person	
Ethernet	Location:	A	
·숐· External Alarms I Operations	Last Power Up:	07/08/2013 11:33:12	
		OK Cancel	Apply

Functions on the left of the dialog box:

System	Edit the contact person and location details. View the system details
Air Interface	Change the Tx Power, cable loss, antenna type and settings. View HSS settings
Management	Configure the IP address, Subnet Mask, Default Gateway, Trap Destination and VLAN
Inventory	View the hardware and software inventory (product identification, versions, MAC address and serial number)
Security	Change the Community Values and the Link Password. Set Link Lock.
Date and Time	Set the date and time of the link from an NTP servers or from the managing computer

	Choose Hub or Bridge ODU mode, IDU aging time, set the
Advanced	Ethernet ports configuration, set max. information rate, TDM
	MHS status, set the external alarm inputs, restore factory
	settings, set IDU detection mode.

Functions at the top of the dialog box:

Backup	Save the current ODU software to a file
Restore	Restore an ODU's software or configuration from a backup file created by the backup facility
Refresh	Refresh current panel with latest values
Installation Mode	Return to Installation Mode for the entire link. Selecting the Mute check box before clicking the Install Mode button mutes the Beeper.
Buzzer	Mutes the alignment tone in installation mode. Reactivate the beeper during alignment.

To edit the Configuration Parameters:

1. Click the required site button on the main tool bar of the Link Manager

OR

Click Configuration from the main menu and choose a site to configure. The

Configuration dialog box opens (see Figure 9-1 above).

- 2. Choose the appropriate item in the left hand list to open a dialog box.
- 3. Click Apply to save changes.

In subsequent instructions, we will simply say "Choose a site to configure" on the understanding that the foregoing procedure is implied.

Viewing System Details

This is the first window displayed - as depicted above. You can edit the contact details and site names.

Viewing Air Interface Details

Click the Air Interface item in the left hand list. A window similar to the following appears:

Changing the Transmit Power

♣ Operations	EIRP		36.5 DK	[dBm]	Apply

Figure 9-3: Changing the Antenna Type and Transmit Power

The Antenna Connection type reflects the installed ODU. In our example, we are using an external antenna on a NetStream 5x200 ODU, so the first two fields are set and grayed out as shown. If you have a connectorized NetStream 5x25 and 5x10 models, you will be able to switch between external and integrated antennas.

The antenna type (Dual, Single) may only be changed if you access the ODU by Local Connection.

For detailed explanation about the relationship between the Tx power, antenna gain and cable loss parameters, see Installation, Step 4.

Changing the Tx Power will affect service quality. The same considerations apply here as were noted in the Installation procedure, Step 4.

Hub Site Sync

Here you can view the HSS status. For our example, HSS is disabled and the status is as follow:

P Site Configuration - A					×

For further details about HSS, see Chapter 11.

Site Management: IP Address, VLAN and Protocol

Configuring the ODU Address

Each site must be configured separately. For an over-the-air configuration, first configure site B then site A so as to avoid lockout. See **Chapter 25** for detailed instructions about the best way to do this on-site.

See Chapter 18 for further details about VLAN Functionality for NetStream.

> To define the Management Addresses:

1. Choose a site to configure. The Configuration dialog box opens:

Site Configuration - A			
File Actions Help			
Backup Restore	▼ 🛃 Refresh	Buzzer Off → Installation Mode	
 System Air Interface Tx Power & Ant Hub Site Sync Management 	Management Network Parameters VLA IP Address: Subnet Mask:	AN Protocol 10 . 104 . 2 . 2 255 . 255 . 0 . 0	
 Inventory Security Date * Time 	Default Gateway: Trap Destination	10 .104 . 10 . 21	
 Date & Time Advanced Ethernet TDM Services External Alarms Operations 	IP Address 0.0.0.0 0.0.0	Port	
	·	OK Cancel Apply	

Figure 9-5: Management Addresses - Site Configuration dialog box

- 2. Choose Management.
- 3. Enter the IP address of the ODU in the IP Address field.

If performing configuration from the Link Manager, the IP address is that entered from the Login window.

- 4. Enter the Subnet Mask.
- 5. Enter the Default Gateway.

Configuring IP Addresses for Trap Destinations

- To enter a Trap Destination:
 - 1. In the Trap Destination table, double click a line to be edited. The following entry window is displayed:

Trap Destination		×
IP Address:	2.0.0.0	
Port:	162	
SNMP Model:	SNMPv1 -	
User Name:		
Password:		
	ОК	Cancel

- 2. Enter the Trap Destination IP Address and Port. It could be the IP address of the managing computer. The events log will be stored at the addresses chosen.
- 3. For Security model you may choose between SNMPv1 or SNMPv3. The choice is site dependent. If you choose SNMPv1, you may only enter an IP address and port number. For SNMPv3, you should supply a user name and password:

Trap Destination		×
IP Address:	192 . 168 . 222 . 141	
Port:	162	
SNMP Model:	SNMPv3	
User Name:	John	
Password:	•••••	
	ок	Cancel

4. Click **OK** to save your choice. Here is the result:

Trap Destination	
IP Address	Port
192.168.222.141	162
0.0.0.0	162
0.0.0.0	162
0000	100

At any time, click **Apply** to save accumulated Management changes.

Configuring VLAN for Management

VLAN IDs are used by Netronics products in three separate contexts: Management VLAN, Traffic VLAN and Ethernet Ring. It is recommended that you use different VLAN IDs for each context.

VLAN Management enables separation of user traffic from management traffic whenever such separation is required. It is recommended that both sides of the link be configured with different VLAN IDs for management traffic. (This reduces your chances of accidentally locking yourself out of the link.)

> To enable VLAN management:

1. Click **Configuration** from the main menu.

2. Choose a site to configure. If you are configuring both sites, choose site B first to avoid locking yourself out.

- 3. Choose Management.
- 4. Open the VLAN tab.

Site Configuration - A	To April 1942		No.	×
File Actions Help				
Backup Restore	▼ 🔊 Refresh	🚳 Buzzer Off	↓ ^(*) Installation Mode	
 System Air Interface Tx Power & Ant Hub Site Sync Management Inventory Security Date & Time Advanced Ethernet TDM Services External Alarms Operations 	Management Network Parameters VL4 Enabled VLAN ID: VLAN Priority:	N Protocol		
		ОК	Cancel	Apply

Figure 9-6: Configuring management traffic VLAN Settings

- 5. Check the **Enabled** box.
- 6. Enter a VLAN ID. Its value should be between 1 and 4094.

After entering the VLAN ID, only packets with the specified VLAN ID are processed for management purposes by the ODU. This includes all the protocols supported by

the ODU (ICMP, SNMP, TELNET and NTP). The VLAN priority is used for the traffic sent from the ODU to the managing computer. Using VLAN for management traffic affects all types of management connections (local, network and over the air).

- 7. Enter a Priority number between 0 and 7.
- 8. Change the VLAN ID and Priority of the managing computer NIC to be the same as those of steps 6 and 7 respectively.

Changing this parameter causes the Link Manager to immediately disconnect. To avoid inconvenience, you should verify the change by setting the VLAN only to one ODU, and only after verifying proper management operation, change the other ODU VLAN setting.

9. Click Apply or OK.

Lost or forgotten VLAN ID

If the VLAN ID is forgotten or there is no VLAN traffic connected to the ODU, then reset the relevant ODU.

During the first two minutes of connection, the ODU uses management packets both with and without VLAN. You may use this period to reconfigure the VLAN ID and priority.

Supported Protocols

Supported protocols are shown in Figure 9-7.

Figure 9-7: Supported Protocols

SNMP support is permanently enabled. You may choose between SNMPv1, SNMPv3 or both. If you choose SNMPv3, you will be offered the following cautionary message:

For a link managed in a network, direct access to an ODU using Telnet is considered to be a security breach. Telnet access may be enabled or disabled by clicking the Protocol tab and enabling/disabling Telnet access using the Telnet check-box. Similar considerations apply to access via the Web Interface.

- For further details about Telnet access see page 175.
- For further details see Chapter 28.

Telnet and Web Interface access modes when available, are site specific. If for example, site A is the operator site and site B the client site, you may wish to disable these protocols for site B but leave them enabled for site A.

If either access mode poses a general security risk, you must disable them for each site separately

Displaying the Inventory

To view the inventory data

- 1. Choose a site from the main menu. The Configuration dialog box opens.
- 2. Choose Inventory.

Figure 9-9: Available security features

Changing the Link Password

This item is only available when the link is down. Otherwise, it works the same way as the corresponding item on Chapter 6.

Link Manager Community Strings

The ODU communicates with the Link Manager using the SNMPv1 or SNMPv3 protocol. The SNMPv1 protocol defines three types of communities:

- **Read-Only** for retrieving information from the ODU
- Read-Write to configure and control the ODU
- **Trap** used by the ODU to issue traps.

The Community string must be entered at log on. You must know the password and the correct Community string to gain access to the system. You may have read-only privileges. It is not possible to manage the ODU if the read-write or the read Community values are forgotten. A new Community value may be obtained from Netronics Customer Support for the purpose of setting new Community. You must also have available the serial number or the MAC address of the ODU. The read-write Community strings and read-only Community strings have a minimum of five alphanumeric characters. (**bru1** and **bru4097** are not permitted). Changing the trap Community is optional and is done by clicking the check box.

Editing SNMPv1 Community Strings

The Community change dialog box is available from the **Configuration | Security** tab. Both readwrite and read-only communities must be defined.

On logging on for the first time, use the following as the current Community:

- For Read-Write Community, use *netman*.
- For Read-Only Community, use *public*.
- For Trap Community, use *public*

To change a Community string:

- 1. From the Configuration dialog box, choose the Security tab.
- 2. Type the current read-write Community (default is *netman*).
- 3. Choose the communities to be changed by clicking the check box.

4. Type the new Community string and re-type to confirm. A community string must contain at least five and no more than 32 characters excluding SPACE, TAB, and any of ">#@|*?;."

5. Click **OK** to save.

Editing SNMPv3 Passwords

To commence the process, you must enter the current Read-Write Community password as shown in the first field of **Figure 9-10** below. Change the Read-Write and Read-Only passwords as indicated. A password must be between 8 and 31 characters long. The same charac-ter restrictions for the SNMPv1 community strings also apply here.
Security Features

R Change Community/Password - A
Enter current Read-Write Community / SNMPv3 Password:
Read-Write Community / SNMPv3 Password New: Confirm:
Read-Only Community / SNMPv3 Password New: Confirm:
Trap Community(SNMPv1 only) New: Confirm:
Hide characters Forgot Community/Password? OK Cancel

Figure 9-10: Changing the Community String

Forgotten Community string

If the read-write Community string is unknown, an alternative Community key can be used. The alternative Community key is unique per ODU and can be used only to change the Community strings. The alternative Community key is supplied with the product, and should be kept in a safe place.

If both the read-write Community and the alternative Community key are unavailable, then an alternative Community key can be obtained from Netronics Customer Support using the ODU serial number or MAC address. The serial number is located on the product label. The serial number and the MAC address are displayed in the Site Configuration inventory tab.

When you have the alternative Community key, click the **Forgot Community** button and enter the Alternative Community key (Figure 9-11). Then change the read-write Community string.

Figure 9-11: Alternative Community Dialog box

Link Lock Security Feature

Link Lock is a part of NetStream security concept intended to meet a form of abuse encountered in the field. It is designed to prevent the situation where a remote ODU can be stolen and used as a "pirate" link to steal services or information. The Link Lock feature actually locks the local ODU to be synchronized ONLY to specific remote ODU. It is a *site oriented* feature.

The lock can only be set from a live link. It is based on MAC authentication and is site oriented and activated on a per ODU basis. For example, if you lock the Site B ODU to the Site A ODU, you must still lock the Site A ODU to the Site B ODU to ensure complete two way locking.

Link Lock can only be removed when the link is unsynchronized. In such a case, an alarm is raised by the Link Manager.

To enable Link Lock:

- 1. Click Site A on the main tool bar.
- 2. Choose the Security tab. The following window is displayed:

Site Configuration - A	To Appendix (Sag		-	×
File Actions Help				
Backup Restore	▼ 😰 Refresh	🖏 🗸	Ninstallation Mode	
 System Air Interface Tx Power & Ant Hub Site Sync Management Inventory Security Date & Time Advanced Ethernet TDM Services External Alarms Operations 	Security Community SNMP Communities: Link Password Link Password Value: Link Lock		Change	
		ОК	Cancel	Apply

3. Click the Link Lock check box and then **OK**. You are asked to confirm the lock:

Site Cont	iguration - A	×
?	You are about to change ODU parameters. The ODU that you are configuring can be synchronized exclusively to its partner ODU. Do you want to continue?	Yes No
		More Info >>

4. Click the **Yes** button and you are returned to the main window of the Link Manager.

Observe that a link icon is now displayed in the status bar on the bottom right of the Link Manager window.

The link to the remote unit is now locked and the Security screen will look like this:

Site Configuration - A						
File Actions Help						
Backup Restore	▼ 🔮 Refresh	🖏 Buzzer Off	Installation Mode			
 System Air Interface Tx Power & Ant Hub Site Sync Management Inventory Security Date & Time Advanced Ethernet TDM Services External Alarms Operations 	Security Community SNMP Communities: Link Password Link Password Value: Link Lock		Change			
		ОК	Cancel	Apply		

The Link Lock check box is now unavailable.

5. If required, repeat the procedure for Site B.

To revert the Link Lock status to unlocked, power down each ODU in turn. Use the above procedure to uncheck the Link Lock status box for the live ODU.

A simple ODU reset at either end will restore the link to its previous locked or unlocked state.

Setting the Date and Time

The ODU maintains a date and time. The date and time should be synchronized with any Network Time Protocol (NTP) version 3 compatible server.

During power-up the ODU attempts to configure the initial date and time using an NTP Server. If the server IP address is not configured or is not reachable, a default time is set.

When configuring the NTP Server IP address, you should also configure the offset from the Universal Coordinated Time (UTC). If there is no server available, you can either set the date and time, or you can set it to use the date and time from the managing computer. Note that manual setting is not recommended since it will be overridden by a reset, power up, or synchronization with an NTP Server.

The NTP uses UDP port 123. If a firewall is configured between the ODU and the NTP Server this port must be opened.

It can take up to 8 minutes for the NTP to synchronize the ODU date and time.

To set the date and time:

- 1. Determine the IP address of the NTP server to be used.
- 2. Test it for connectivity using the command (Windows XP), for example:

w32tm /stripchart /computer:216.218.192.202

You should get a continuous response of times, each a few seconds apart.

3. Choose a site to configure.

The Configuration dialog box opens.

4. Choose Date & Time:

Setting the Date and Time

Site Configuration - A

Ethernet Properties

ODU Mode

- **Hub Mode** In Hub mode the ODU transparently forwards all packets over the wireless link.
- **Bridge Mode** In Bridge mode the ODU performs both learning and aging, forwarding only relevant packets over the wireless link. The aging time of the ODU is fixed at 300 seconds.

Changing these modes requires system reset.

NetStream 5x200 ODUs work in Hub mode only and bridging is performed by the IDU-NetStream RM. The bridge capability is built in to the IDU-NetStream RM (it is not configurable).

Other NetStream models control the choice of Hub or Bridging mode.

Configuring the Bridge

Bridge configuration is required in various network topologies, such as protection (Ethernet 1+1) and ring applications.

l	OK Cancel Apply

Figure 9-16: Bridge, VLAN and MIR Configuration using a PoE device

In Figure 9-15 and 9-16, the ODU supports GbE and may operate at up to 1000 Mbps. The latest IDU-NetStream RM models (hardware versions 6 and later) and the new GbE PoE will support up to 1000 Mbps at their LAN ports. A suitable SFP module will also support GbE.

IDU Aging time

This parameter controls the IDU aging time.

The aging time parameter controls the time after which each MAC address is dropped from the MAC address learning table.

The default value is 300 seconds.

- Any change to these parameters is effective immediately.
- Each side of the link can be configured separately, with different aging times.

The following table shows the appropriate configuration for several common scenarios. Both link sites must be configured with the same parameter:

Table 9-1: ODU mode configuration for	common scenarios
---------------------------------------	------------------

Scenario	ODU Mode	IDU Aging Time
Standard (default) Configuration for Ethernet Applications	Bridge	300 sec
Rapid network topology changes where fast aging is required	Hub	1 sec

Configuring Ethernet Ports Mode

The ODU Ethernet port mode is configurable for line speed (10/100/1000BaseT) and duplex mode (half or full duplex).

An Auto Detect feature is provided, whereby the line speed and duplex mode are detected automatically using auto-negotiation. Use manual configuration when attached external equipment does not support auto-negotiation. The default setting is Auto Detect.

You should not reconfigure the port that is used for the managing computer connection, since a wrong configuration can cause a management disconnection or Ethernet services interruption.

To configure the Ethernet Mode:

- 1. From the **Configuration** menu, choose the site to configure. The Site Configuration dialog box opens.
- 2. Click Advanced | Ethernet.
- 3. In the Ethernet Ports Configuration pane, use the drop-down menu to choose the required mode.
- 4. Click **Apply** to save the changes.

It is possible to close the Ethernet service by disconnecting the Ethernet port.

If you close the port, you may subsequently be unable to access the device. If this should occur, a workaround is as follows:

- Connect to the system from the remote site
- Connect via other Ethernet port (of the IDU)
- Power down the equipment and connect immediately after power up (the fastest way is to enter install mode)

The **Mode and Radio Link Failure Action** options vary somewhat with IDU or PoE type. For a GbE PoE device they are respectively, as follows:

Port Connections

For IDU-NetStream RM based links the Port Connections window enables you to control communication between the two LAN ports and the SFP:

Port Connections
LAN1 - LAN2: Connected
LAN1 - SEP: Connected
LAN2 - SEP: Connected
OK Cancel

The port combinations shown may be **Connected** or **Disconnected**. For IDU-NetStream DTs, you will only see LAN1-LAN2.

CRC Error Detection for GbE Ports

The CRC error count for GbE LAN ports may be seen as mouse-over tool-tips:

Ethernet Por	ts Configuration				
Port	Current	Mode		Radio Link Failure Actio	
ODU	100Mbps/Full Duplex	Auto Detect	~	No Action	~
LAN 1 🔔	1000Mbps/FD	Auto Detect	~	No Action	~
LAN 2	RC: 17 isconnected	Auto Detect	-	No Action	~
SFP	Disconnected	1000Mbps/FD	-	No Action	×
	Port	t Connections			

Figure 9-17: GbE LAN Port with CRC error warning and CRC count tool-tip

The occurrence of CRC errors on a port is indicated by the yellow triangular caution sign; to see the CRC error count, mouse over the caution sign.

VLAN Tagging for Ethernet Service: Configuration

VLAN IDs are used by Netronics products in three separate contexts: Management VLAN, Traffic VLAN and Ethernet Ring. It is recommended that you use different VLAN IDs for each context.

Two modes of VLAN tagging for Ethernet service are supported: ODU mode for PoE links and IDU mode for links using IDU-NetStream RMs.

VLAN Tagging - ODU Mode

If the ODU is configured with either

- a PoE device instead of an IDU-NetStream RM
- an IDU-NetStream RM with IDU detection disabled

the window shown in Figure 9-16 will be displayed. Clicking the **ODU VLAN Configuration** button opens the following window:

ODU VLAN Configuration	X
Ingress Mode	Egress Mode
Transparent	Transparent 💌
Allowed VLAN IDs:	VLAN ID:
ODU VLAN Configuration will be applied if no IDU is conne or IDU detection mode is disabled."	ected to the ODU
	UK

Figure 9-18: ODU VLAN Configuration

The Ingress options are:

	Ingres	s Mode	
Transparent			
Transparent			
, Untag all Filter			
] [

Transparent mode passes through all frames transparently. **Untag all** removes tagging from all frames. **Filter** mode passes through packets with VLAN IDS listed in the table. Untagged packets are also filtered. They are blocked by the ODU.

The table of Allowed VLAN IDs is enable when you select the Filter option. You may enter up to eight VLAN IDs.

	Ingress	Mode	
Filter			•
Allowed VLAN IDs:			
	_		

The **Egress** options are:

Egress Mode						
Transparent Transparent Tag Provider tagging VLAN Priority:						

Transparent mode passes frames without tagging. Both **Tag** mode **Provider Tagging** each requires that you assign a VLAN ID and VLAN Priority:

Tag	 Provider tagging 	Provider tagging 🗸		
VLAN ID:	VLAN ID:			
VI AN Priority:	VI AN Priority:			

The VLAN ID must be in the range 2 to 4094 and the VLAN Priority is an integer between 0 and 7. When you are done, remember to click **OK** (Figure 9-18).

VLAN Tagging - IDU Mode

To set up IDU mode VLAN tagging for Ethernet Service, click the **VLAN Configuration...** button in **Figure 9-15**. The following window is displayed:

VLAN Cor	figuration	
VLAN W	/orking Mode: Normal 💌	
	Ingress Mode	Egress Mode
	Transparent	Transparent
LAN1	VLAN ID:	
	Transparent	Transparent
LAN2	VLAN ID:	
	Transparent 🔹	Transparent
SFP	VLAN ID:	VLAN ID:
		Provider parameters are common to all ports Provider parameters
		VLAN ID: VLAN Priority:
		OK Cancel

Figure 9-19: VLAN tag settings

If you are using a new style IDU-NetStream DT, the SFP row will not appear.

In **Normal** mode, you must manually assign each required VLAN ID to a port, whether for tagging or untagging. **Membership** mode allows you to allocate blocks of VLAN IDs.

Normal Mode

The choices for Ingress Mode are -

	Ingress Mode
LAN1	Transparent Transparent Tag VLAN ID: VLAN Priority:

and for Egress Mode are -

Egress Mode	
Transparent	•
Transparent	
Untag all	
Provider tagging	
Provider tagging without filter	
Filtered VLAN IDs	

Membership mode

In Membership Mode you may assign VLAN IDs in blocks to the ports. The next three figures show the work flow.

VLAN Configuratio	on	(Ingention)	-	X
Manhanaking W				
Membership	VLAN ID	LAN1	LAN2	SFP
	Add range From: 2 To: 4	CK	✓ LAN2 SFP Cancel	
Untagged Fr	ame		Add	Add Range
LAN1	Discard -	VLAN ID:	VLAN Prior	ity:
LAN2	Discard -	VLAN ID:	VLAN Prior	ity:
SFP	Discard -	VLAN ID:	VLAN Prior	ity:
				OK Cancel

> To configure VLAN using Membership mode:

1. Add a range of VLAN IDs or a single line item.

Ethernet Properties

	4		8	7		
Untagged Fra	ame	Configured 3 of	of 24 VLAN ID	is Ad	d Add Range	
LAN1	Discard	VLAN ID:		VLAN Pric	ority:	
LAN2	Tag Unmodified	VLAN ID:		VLAN Pric	ority:	
SFP	Discard -	VLAN ID:		VLAN Pric	prity:	
					OK Cance	

3. Set untagged port VLAN IDs as required and click **OK** to accept. At any point you may return to the last display to see you VLAN assignments.

The details of setting up VLAN tagging require advanced network management skills beyond the scope of this manual. Further information for the Network Manager is provided in **Chapter 18**.

Completely Disabling VLAN

It may be necessary to disable VLAN for several reasons apart from re-configuration. For example, setting a VLAN ID to the LAN port used by the managing computer can effectively lock you out of the link. The remedy for this situation is to reset the relevant site(s) and log on again. You have "two minutes of grace" before the VLAN settings take hold. During this period, you should navigate to **Site Configuration | Ethernet** and then click the **Disable VLAN** button. Any VLAN settings for the site will be lost.

Setting the Maximum Information Rate (MIR)

What is the MIR

The maximum Ethernet throughput of the link (MIR) can be limited. The default setting is *Best Effort* (see Figure 9-15 above), where the highest information rate available for the link conditions and settings is used.

What is it for

The MIR setting limits the throughput for Ethernet service. It does not affect the capacity of TDM services.

If the Link Budget Calculator or air conditions limit the capacity to X Mbps, and suppose that you use Y (< X) Mbps for TDM services, then you are left with X - Y=Z Mbps for Ethernet.

Suppose for example, that Z = 20 Mbps.

As a Service Provider, you can decide to sell a package based on 10 Mbps and charge \$P1 for it, or 15 Mbps for \$P2 > \$P1.

The MIR setting allows you do this.

The default value is "best effort" (shown as "Unlimited") which will give Z above.

The minimum value is 256 Mbps.

The maximum value will be the minimum between Z above and -

- 25/10 Mbps for NetStream 5x25 and 5x10 (Model dependent)
- 50 Mbps for NetStream 5x50
- 20 Mbps for NetStream 5x20
- 200 Mbps for NetStream 5x200

The MIR setting is independent per direction.

> To limit the Ethernet information rate:

- 1. From the **Configuration** menu, choose the site to reconfigure.
- 2. Click Advanced | Ethernet

The Configuration dialog box opens.

Figure 9-21: Ethernet MIR - Throughput selection

- 4. Choose **Other** to define the throughput with 1 Kbps resolution
- 5. Choose **Best Effort** for the highest information rate possible for the link conditions and settings
- 6. Click **Apply** to save the changes.

Setting the sync-loss Threshold

You may change the sync-loss threshold by clicking the **sync-loss Threshold** button:

5	Sync Loss Threshold	-	? ×
	Threshold [Kbps]:	0	Restore Default
		C	OK Cancel
L			

The sync-loss threshold value, which you enter is absolute. sync-loss will only occur if throughput falls below it.

- The default value is determined by an algorithm taking into account your current link radio parameters.
- There is a provision to override an excessively high value that would lead to continuous sync-loss "thrashing": An excessively high value will be ignored by the system.
- An excessively low value may prevent sync-loss events almost entirely, in turn preventing the ACS mechanism from working effectively.

TDM MHS Status

Here you can see the TDM MHS status. There is nothing to set.

Setting External Alarm Inputs

The IDU-NetStream RM and the IDU-NetStream DT have four external alarm inputs and four external alarm outputs in the form of dry contact relays. The Alarm interface is located on the front panel of the IDU-NetStream RM and is a 25 pin D-type female connector. See Appendix B, for wiring specifications and pin out. You may enable or disable each of the alarms and configure the alarm description text appearing in the alarm trap message. The ODU sends the alarm within less than a second from actual alarm trigger.

Fo set the external alarm inputs:

Site Configuration - A						×

				ок	Cancel	Apply

1. Choose External Alarms from the Site Configuration window.

Figure 9-23: External Alarms Configuration

- 2. Choose an alarm and set its mode to Enabled or Disabled
- 3. Enter a description of the alarms in the text field.
- 4. Click **Apply** to save.
- 5. Click **OK** to exit from the dialog.

Resetting

You may reset the link, preserving the current configuration, or reset to factory defaults.

Resetting the link causes service disconnection.

To maintain the connection between the managing computer and the link, first reset Site B.

> To reset the link preserving current configuration:

- 1. From **Maintenance** on the main window, reset the remote unit.
- 2. From **Maintenance** on the main window, reset the local unit.

For a set to Factory Defaults

- 1. Choose either of the sites to be reset. The Configuration dialog box opens.
- 2. Choose **Operations** in the Configuration dialog box.

Site Configuration - A				×

		ОК	Cancel	v

Figure 9-24: Site Configuration - Reset to factory defaults

- 3. Click the Restore Defaults button.
 - A message box asking if you want to restore factory default settings appears.

Are you sure you want to Restore Factory Default Settings? The link may be unreachable after the process.
This process takes several seconds and is followed by a device reset.
Default IP Address (10.0.0.120).

- 4. Click the check box if you want to keep the current IP address settings.
- 5. Click Yes to continue.

After a few moments the site will be reset and you will need to log on to it to reinstall the link.

IDU Detection

An ODU always tries to detect the IDU to which it is connected. IDU Detection is affected by an IDU responding to special ODU packets.

If a PoE device is in use, the detection packets spread to the containing network and may cause flooding. In such a case, the IDU Detection feature, (Figure 9-24), should be disabled.

To disable IDU Detection Mode, just toggle the check box in Figure 9-24.

Backup/Restore of ODU Software Files

Backup ODU Software to a File

Link Manager allows you to backup the ODU software of both units of a link to the managing computer as binary files. Each site is backed up in a separate file. Backup files are matched to the MAC address of the site ODU. The default backup file name is constructed from the ODU IP address and the date as in the following example:

Backup of Site A as used in our examples:

192.168.1.101_1.12.2009.backup

If you perform more than one backup on a given date you will need to change the file name to something like this:

192.168.1.101_1.12.2009_00.backup

192.168.1.101_1.12.2009_01.backup

•••

To backup the ODU software a file:

- 1. Choose a site to back up. The Site Configuration dialog box opens.
- 2. Click Backup.

3. In the Save As dialog box, indicate in which folder and under what name configuration file is to be saved, and click **Save**.

Restoring ODU Software or Configuration

Backup files can be uploaded from the managing computer. You may choose a full software restore or configuration-only restore. You may restore a backup file to another ODU subject to the following provisions:

- The backup was performed with Link Manager, release 2.8.20 or higher
- The source and target ODUs have the same
 - Product ID
 - Hardware version
 - Capacity

You can check Product ID, Hardware version and Capacity from the Inventory display for the source ODU.

To restore from a backup file:

- 1. Choose a site to restore (from a previous backup). The Site Configuration dialog box opens.
- 2. Click **Restore**. You are offered the choice of a Full or Configuration Restore as shown:

- 3. Click the required Restore type. You are then offered a standard Open File dialog box.
- 4. From the Open File dialog box, navigate to your backup storage area and choose file to upload. Click **OK**.

Muting the alignment tone buzzer

The ODU alignment tone becomes audible as soon as power is supplied, and continues until the ODUs are aligned and the link established.

It is possible to mute the tone during regular operation of the link. It must be enabled when performing the alignment procedure.

To mute the alignment tone buzzer:

1. Choose a site. The Configuration dialog box opens.

2. In the Configuration dialog box, click the **Buzzer** button.

Figure 9-25: Alignment tone buzzer states

3. Click **Off**. The tone is disabled.

> To restore the alignment tone buzzer:

- 1. Choose a site. The Configuration dialog box opens.
- 2. Click **On** to have the buzzer beep continuously or **Auto** to have the buzzer beep only in install mode.

Configuration with Telnet

A Telnet terminal can be used to configure and monitor the NetStream. To start a Telnet session,

use telnet <ODU_IP>.

For example, if you run Telnet as follows,

telnet 192.168.1.101

you will be asked for a user name and password.

The Telnet log on user name is the password that you used to enter the Link Manager (for example, the default: *admin*). The Telnet password is the corresponding Community string (default: *netman*).

Figure 9-26: Telnet session log on

A Read-Only Community string allows display only whereas a Read-Write Community string allows display and set commands.

Supported Telnet commands are shown in Table 9-4. Note that some of the commands are model specific. For example, TDM commands will not apply to Ethernet only and PoE based links.

Command	Explanation
display inventory	Displays ODU product name, Name, Location, hardware and software revisions, uptime, MAC address, IDU product name, IDU software and hardware revisions
display management	Displays IP, Subnet, Gateway, Traps table
display link	Displays State, Link ID, Channel BW, RSS, TSL, Frequency/ACS, DFS, Rate/ARA, Distance
display ethernet	Displays Bridge Mode, Aging time, Port table (State, Status and action)
display ethernet_errors	Display FCS errors for ODU/IDU Rx, IDU LAN1/LAN2
display tdm	Displays Clock Mode, Master Clock Mode, Current Clock, Quality, TDM table (Line status, Error Blocks)
display ntp	Displays Time, Server and Offset
display PM <interface:air,lan1,lan2,tdm1, TDM2,,TDM16><interval:current,day,month></interval:current,day,month></interface:air,lan1,lan2,tdm1, 	Shows the performance monitor tables for each interface according to user defined monitoring intervals
display bands	Display available bands
display ratio	N/A
display syncloss_thresh	N/A

set ratio <1-1000>	N/A
set dual_tx_mode (mode: 1=MIMO, 2=Diversity)	Set dual antenna mode to MIMO or Diversity
set preferred frequencies clear	N/A
set preferred frequencies add <freq></freq>	N/A

Chapter 10

Monitoring and Diagnostics

The Link Manager application enables you to monitor the link, as well as perform diagnostic operations such as loopback tests.

This chapter covers:

- Retrieving link information
- Link compatibility issues
- TDM port loopbacks
- Reinstalling and realigning a link
- Link Budget Calculator
- Performance monitoring
- Throughput checking
- Events, alarms and Traps
- Reverting alert messages
- Remote power fail indication
- Troubleshooting
- Replacing an ODU
- Restoring to factory setup
- Online help
- Obtaining support

Retrieving Link Information (Get Diagnostics)

The Get Diagnostics feature collects and writes all link and Manager information (from both sites) into a text file. The file information can be used for diagnostics and should be sent to Netronics Customer Support to speed up assistance.

The following table lists link and system information that can be monitored.

Table 10-1: Get Diagnostics	Data and	Description
-----------------------------	----------	-------------

Data	Description
System Data	General information about the system
Link Information	Information about the link properties
Events Log	 List of system events including those from other sites if this site is defined as the trap destination Last 256 events from both sites
Site Configuration	Data about the site parameters
Active Alarms	List of active alarms
Performance Monitor	Network performance data over defined time periods
Monitor	Detailed event data record
Spectrum View	Data from last Spectrum View run

To get diagnostics

1. From the **Help** menu, choose **Get Diagnostics Information**.

Get Diagnostics Information	ation	x		
File Help				
Start Stop File Path Available Data	Close			
📝 System Data	ОК			
🔽 Events Log	OK			
Link Information	ОК			
Site Configuration	ОК			
Active Alarms	ОК			
Performance Monitor	OK			
Monitor	ОК			
Spectrum View	OK			
File Path: D:\My Document:	s\Diagnostics Information.txt			
Diagnostics Information process has been completed.				

Figure 10-1: Get Diagnostics Dialog Box

- 2. Select or deselect the data options. If the file is to be sent to Netronics Customer Support leave all options checked.
- 3. Click **File Path** to specify the folder in which you want to save the file and then click **Start** to save the information.

The file is saved in the specified folder as Diagnostics Information.txt

Link Compatibility

Link Compatibility indicates the version compatibility using software traps. As new hardware or software is added to existing networks compatibility issues may arise. An incompatibility issue is indicated to the user by a change of color of the Link Status box on the Main Menu window. Trap messages (can be viewed in the Events Log) indicate the problems or limitations and suggest upgrades when appropriate.

The following Link Status messages are given:

fullCompatibility - different software versions were detected that are fully compatible. Themessage indicates that an upgrade is available.

restrictedCompatibility - different software versions were detected that operate correctly.However, new features are not supported.

softwareUpgradeRequired - different software versions were detected allowing limited operation. The message is, that a software upgrade is required.

versionsIncompatibility - different software versions were detected that are incompatible. You need to perform local upgrades.

Link State	Link State text	Link Status Color	Site Description
fullCompatibility	Active	Green	Software Upgrade Available
restrictedCompatibility	Active - Software Version mismatch	Magenta (Same as authenticatio n error)	Software Upgrade Recommended
softwareUpgradeRequired	Active – Software Upgrade Required	Brown (Major)	Software Upgrade Required
versionsIncompatibility	Not Active - Software Upgrade Required	Red	Local Software Upgrade Required

Table 10-2: Link Compatibility Trap Messages

TDM Loopbacks

Internal and external loopbacks on both sites of a link are used to test the TDM connections

- > To activate a loopback:
 - 1. From the Maintenance menu, choose **Loop backs...** or right-click the TDM display in the main window.

The Loopbacks dialog box appears:

G Loopbacks			? ×
Help			
Loopback Configuration			
Configure Select Maximu	m Deselect All	Configure Select Max	imum Deselect All
A		В	
1 3 5 7	9 11 13 15	1 3 5 7	9 11 13 15
2 4 6 8	10 12 14 16	2 4 6 8	10 12 14 16
		ſ	OK Cancel

2. From the active ports, click those required for loopback activation. The selected port icons change color to light blue as in the following example:

G Loopbacks				? ×
Help				
Loopback Configuration				
Configure Select Max	imum Deselect All	Configure	Select Maximum	Deselect All
A		в		
1 3 5 7	9 11 13 15	1 3	5 7 9	11 13 15
2 4 6 8	10 12 14 16	2 4	6 8 10	12 14 16
			ОК	Cancel

Figure 10-3: Loopback configuration box with one Site A port selected

3. Click configure to choose a loopback mode:

Figure 10-4: Loopback options

TDM Loopbacks

4. Click the required loopback mode.

Figure 10-6: Site A port 2 set to loopback

• Return to the situation of Figure 10-4 and click None.

When a loopback is deactivated, the corresponding icon in Figure 10-6 reverts to its previous state (like the right side of the figure).

Local Line Loopback

A Local line loopback can be set to test the local E1/T1 port and its connection to local side user equipment. In this mode, data coming from the local user equipment is looped back to it. This loopback is initiated from a managing computer connected to the local unit.

Figure 10-7: Local Line Loopback

Remote Reverse Loopback

A remote reverse loopback can be set to test connection between the local and remote units and between the local E1/T1 port and its connection to the local user equipment. In this mode, data coming from the local user equipment is looped back at the remote side. This loopback is initiated from a managing computer connected to the local unit.

Figure 10-8: Remote Reverse Loopback

Remote Line Loopback

The remote unit can be set to a line loopback to test the remote E1/T1 port and its connection to the remote side user equipment. In this mode, data coming from the remote user equipment is looped back to it locally. This loopback is initiated by the managing computer connected to the local unit.

Figure 10-9: Remote Line Loopback

Local Internal Loopback

The local unit can be set to close a remote loopback to test connection between the local and remote units and between the remote E1/T1 port and its connection to the remote user equipment. In this mode, data coming from the remote user equipment is looped back to it locally. This loopback is initiated by the managing computer connected to the local unit.

Figure 10-10: Local Reverse Loopback
Reinstalling and Realigning a Link

It may be necessary to reinstall the link if the ODUs need to be realigned.

Activating Install Mode causes both sites to go into install mode, causing disruption in service for approximately fifteen seconds.

> To reinstall the link:

1. Choose a site.

The Configuration dialog box opens.

2. In the Configuration dialog box, click the Install Mode button.

A message box asking if you want to enter install mode appears.

3. Click Yes to continue.

The system enters Install mode and the alignment tone becomes audible.

4. Realign the ODUs and start the Installation wizard (see Chapter 6).

The Link Budget Calculator

The Link Budget Calculator is part of the Link Manager software and is found in the Help menu. This useful utility enables you to calculate the expected performance of the wireless link and the possible configurations for a specific link range including antenna size, cable loss and climate conditions. For full details, see Chapter 26.

Throughput Checking

In this mode, NetStream estimates Ethernet throughput by filling frames over the air to maximum for 30 seconds. This mode should not influence service.

To use Throughput Checking:

1. At the main menu, click Maintenance | Estimated Eth. Throughput. A confirmation message appears:

2. Click **Yes** to continue. The Ethernet services area changes appearance and the estimated throughput is displayed:

Ethernet Service:		Rx/Tx Rate Units: 💿 Mbps 💿 Fps
i) Estimated Throughput [Mhos]	36.8	36.8
Estimated miloughput [Mbps]	0, , ,	36.9 0 , 36.
Rx Rate	0.0	0.0
Tx Rate	0.0	0.0

At the end of 30 seconds, the display reverts to normal.

Performance Monitoring

NetStream Performance Monitoring constantly monitors traffic over the radio link and collects statistics data for the air interface, TDM and Ethernet ports. It does so continuously, even when the Link Manager is not connected.

Two types of logs are recorded:

- Monitor Log that records statistics on traffic rate and radio signal strength.
- Events Log that records when the rates fall above or below a predefined threshold. See page 188 below.

Both the statistics Monitor log and events log can be saved as text files.

The Monitor Log

The Monitor Log records performance statistics for predefined intervals. You can save the monitor log to a text file, as well as display the information in an on-screen report.

Saving the Monitor Log

You can save the recorded Monitor Log statistics to a text file.

To save the monitor log:

1. From the Tools menu, choose Preferences. The

Preferences dialog box appears:

Performance Monitoring

F	referenc	es				×
ſ	Monitor	Events	Advanced			
l	Monito	r File				
	File:		D:\My Document	ts∖Monitor.	txt	
	Interv	val:	1 🚔 Sec.			
$\left \right $						
L			OK		Cancel	Apply

Figure 10-11: Preferences dialog box

- 2. Click the Monitor Tab.
- 3. Select the file to save.
- 4. Click the check box to open the file for saving.
- 5. Click the _____ button and in the Select File dialog box indicate in which folder and under what name the monitor log file is to be saved.
- 6. Set the time interval for adding data to the file.
- 7. Click **OK** to save the file.

Viewing Performance Reports

The Performance Monitor Report displays performance views of each of the interfaces.

> To obtain performance monitoring reports:

1. From the main menu, choose **Tools | Performance Monitoring Report ...**

You are presented with the following window:

Performance	Monitoring Rep	ort	-	-		
File View	Configuration	Help				
Get Data	Save	🥑 Clear	Thresholds	Selection Pane	Close

Figure 10-14: Performance Monitoring Report showing the effect of a Reset

The prior data is invalidated as shown by the red crosses in the left hand column. Further, Min and Max RSL for the invalidated period is set to zero.

3. Click the Selection Pane icon to toggle the side panel on or off.

The other reports look similar. Here is a detailed description of the reports and their fields:

Several performance data occurrences are collected for each of the interfaces (ES, SES, and UAS), as well as specific data per Interface type (e.g., Tx and Rx bytes for Ethernet). For the Air Interface, user defined thresholds data are collected. Refer to Table 10-3 and Table 10-4 below.

Data is collected and selectively displayed based on three time intervals as selected by the **Interval** radio buttons:

- Current (t=0)
- 15 minutes Intervals
- Daily

Table 10-3: Explanation of performance data

Data type	Reported Value	Explanation
	UAS – Unavailable Seconds	Seconds in which the interface was out of service.
	Raw ES – Raw Errored Seconds	The number of seconds in which there was at least one error block. Note that the notion of an error block is different per interface.
Generic PM Data	SES – Severe Errored Seconds	The number of seconds in which the service quality was low (the quality is different per type of interface and determined by the BBER threshold per interface).
	BBE – Background Block Error	The number of errored blocks in an interval.
	Integrity	A flag indicating that the data was valid. Note that the Performance Monitoring data is not valid if not all the values were stored (e.g., due to clock changes within the interval or power up reset).

$1 a D = 10^{-}$, $L A D a H a H a H O H D = 10 H H a H C H a H a$	Table 10-3: Ex	planation of	performance data
---	----------------	--------------	------------------

Data type	Reported Value	Explanation			
	Max RSL	The maximum of the receive signal level (measured in dBm).			
	Min RSL	The minimum of the receive signal level (measured in dBm).			
	Max TSL	The maximum of the transmit signal level (measured in dBm).			
	Min TSL	The minimum of the transmit signal level (measured in dBm).			
Additional Air Interface PM Data	RSL Threshold 1	The number of seconds in which the Receive Signal Level (RSL) was below the specified threshold.			
	RSL Threshold 2	The number of seconds in which the RSL was below the specified threshold.			
	TSL Threshold	The number of seconds in which the Transmit Signal Level (TSL) was above the specified threshold.			
	BBER Threshold	The number of seconds in which the Background Block Error Ratio (BBER) exceeded the specified threshold.			
	Received Bytes	The number of Megabytes received at the specified port within the interval			
Additional Ethernet Interface PM Data	Transmitted Bytes	The number of Megabytes transmitted at the specified port within the interval.			
	Throughput threshold	Seconds count when throughput fell below the threshold			
	Traffic threshold	Seconds count when actual traffic exceeded the threshold			
TDM interface	Active seconds	The number of seconds that the configured TDM services are active			

Performance Monitoring Report Toolbar

You can use the toolbar to perform the actions described in the following table:

Table 10-4: Action of	the toolbar buttons
-----------------------	---------------------

Command Button	Action
Get Data	Gather current performance monitoring data.
Save	Save current performance monitoring data to a file
Clear	Clear current performance monitoring data
Thresholds	Set Thresholds
Selection Pane	Toggle on/off left panel
Close	Closes the Performance Monitoring window

Setting Air Interface Thresholds

Use the **Thresholds** button on the Monitoring Performance Report toolbar to set the Air Interface Thresholds:

Threshold	Configuration	- A	? ×
Thresholds			
Air Inte	rface		
RSL #1	[dBm]:	-88	
RSL #2	[dBm]:	-88	
TSL [dB	im]:	25	
BBER [%]:	1	
Etherne	t Interface		
Capacit	y [Mbps]:	0	
Traffic	[Mbps]:	100	
	ОК	Refresh	Cancel

Figure 10-15: Threshold configuration dialog box

RSL Thresholds

Two RSL Thresholds can be defined. They are used as an indicator of problems in the radio channel. You can check the RSS from the Link Budget Calculator (available on product page on Netronics website) results during installation. Values of -5 dB and -8 dB from the current RSS are typical.

TSL Threshold

A counter is maintained, of the number of second intervals during which Tx power exceeds this threshold.

BBER Threshold

The Background Block Error Ratio is measured as a percentage. The threshold can be set from 0.1% up to 50%.

For links with Ethernet only service, 8% threshold is recommended. If there are no problems during the interval, then for that threshold, the recommended BBER value should be 0. Since the system provides a lossless Ethernet service, there is throughput degradation in case of interference. The degradation is proportional to the BBER.

Ethernet Thresholds - Capacity

This is used as a basis for checking adherence to a Service Level Agreement. It is the number of second count that the link capacity falls below the threshold.

Ethernet Thresholds - Traffic

The number of seconds count that received traffic exceeded this threshold. It can be used to measure traffic peaks.

Events, Alarms and Traps

The Events Log

The Events Log records system failures, loss of synchronization, loss of signal, compatibility problems and other fault conditions and events.

The foregoing event types include events from all links for which this managing computer has been defined as the traps address. Only events from NetStream equipment will be shown.

Alarms (traps) are displayed in the Events Log in the lower panel of the main window. The Events Log may be saved as a text file.

The Events Log includes the following fields:

- » Sequential number (ID) Date
- » and time stamp Message
- » Trap source
- » IP address of the ODU that initiated alarm.

For complete information about traps and alarms see Appendix D.

The events are displayed in the Events Log in the lower right hand panel of the Link Manager main window:

Figure 10-16: Events Log Display

To save the Events Log:

1. From the Tools menu, choose Preferences. The

Preferences dialog box appears

- 2. Click the **Events** Tab.
- 3. Select the file to save.
- 4. Click the check box to open the file for saving.

Click the _____ button and in the Select File dialog box indicate in which folder and under what name the Events Log file is to be saved, and click OK.

To store the Events Log, first define the IP address, subnet mask, default gateway and trap destination address of the managing computer (see Chapter 9 for details).

Link Manager Traps

The Link Manager application issues traps to indicate various events, displayed in the Events Log.

Table	10-5:	Link	Manager	Trap	Messages
-------	-------	------	---------	------	----------

Trap Message	Severity	Remarks
Cannot bind to trap service port. Port 162 already in use by ProcessName (pid: ProcessId)	Warning	Link Manager will not catch any traps from the ODU, some other application has grabbed this port. For further detail see <u>thisweb site</u> .

Different IDU Detection Mode at <site1 name=""> and <site2 name=""></site2></site1>	Warning	IDU detection mode set differently at the two sites

Setting the Events Preferences

You can define a color for the messages to be displayed in the Event Log window, according to the severity of the event. The severity is predefined.

> To set the Message color:

1. From the **Tools** menu, choose **Preferences**.

The Preferences dialog box appears.

2. Click the **Events** Tab:

Preferenc	es					×
Monitor	Events	Advanced				
Event	Priority					
Eve	nt Color					
Crit	ical					
Se	vere

Events	Log File					
File: D:\download\EventsLog.txt						
SNMPv3 Trap Authentication						
User:			Passwo	rd:		
			ок		Cancel	Apply

Figure 10-17: Preferences dialog box - Event tab

- 3. Select the event type and click on the _____ button. A color chart opens.
- 4. Select the required color.
- 5. Repeat for each of the event types.

> To set the message background color:

• Click Background Color to change the text background.

To reset the message colors:

• Click Reset Settings to return to the default color settings.

Saving the Events Log

You can save recorded events in an Events Log text file. New alarms are automatically added to the text file, as they enter the Events Log.

SNMPv3 Trap Authentication

The SNMPv3 User and Password are relevant if you are using SNMPv3. In this, case trap messages are keyed to the user name and password and not visible to anyone else. The preferences entered here, relate to trap messages sent to the specified user if specified or to all trap messages, otherwise. For associating a user with a trap address, see **Configuring IP Addresses for Trap Destinations**.

Active Alarms

Upon setting a trap destination, applicable events are reported as active alarms to the user. The active alarms are saved and can be viewed in the Active Alarms window.

> To view summary of saved alarms:

- 1. From the **Tools** menu, choose **Active Alarm Summary**.
- 2. Choose either of the sites offered.

The Active Alarms Summary window opens:

🔏 Active Alarms - A				
File Viev	v Help			
Save	(†) Refresh	Site •	¶, Close	
Device Da	ite & Time		Description	Interface
01/09/20	05 12:00:00	AM	TDM Service - Alarm. The reason is: Service is closed	
01/09/20	05 12:00:14	4 AM	Incompatible IDUs	
01/09/20	05 12:00:30	MA (LAN port 02 status changed to disconnected	
<			III	•

Figure 10-18: Active Alarms Summary

The active alarms display does not update itself until the **Refresh** button is used. The following table provides an explanation of the command buttons.

Table 10-6: Active Alarms command buttons

Command	Action
Save	Saves the alarms in CSV or text format for further analysis
Refresh	Shows the active alarms at the moment of refresh
Site	Selects site for the active alarms
Close	Closes the active alarm window

Viewing Recent Events

Each ODU stores the last 256 events:

To view the last 256 events:

1. Click Tools | Recent Events ... A window like the following is displayed:

Kece	🚯 Recent Events - A				
File	View Help				
Sav	ve Site: A C	lose			
Number	Device Date & Time	Description	Interface	^

- 2. Use the Site button to choose Site B
- 3. Use the Save button to store the events in a tab-delimited list.

Reverting Alert Messages

Many alert messages in the Link Manager have an option of the form "Do not show this message again". These alert messages can be reverted to their default state (shown) by choosing the **Advanced** tab from the Preferences dialog:

Preferences
Monitor Events Advanced
Alerts
Restore Alerts
Quick Install
☑ Enable Quick Install
SNMP parameters
Monitor Interval: 1 📥 Sec.
Timeout: 1 🛓 Sec.
OK Cancel Apply

Figure 10-20: Advanced Preferences

Just click the **Restore Defaults** button, followed by **OK**.

Other Advanced Preferences

Setting SNMP Parameters

Use these choices to set the SNMP monitoring interval and time-out. These are only significant if you are using an SNMP based network management system.

Remote Power Fail Indication

Remote power fail indication indicates to one side that the other side has suffered a power failure. The failed site sends a final trap indication about the power loss just before powering off.

A "Dying Gasp" circuit identifies the power failure at a minimum interval of 20 milliseconds before the ODU or IDU powers off. During that interval a message notifying the power failure is sent to opposite site. External alarm output number 4 indicates power failure at the opposite site.

Troubleshooting

Use the following table to troubleshoot LED fault indications:

LED	Status	Remedy	
PWR	Off	Check that power is connected to the IDU	
IDU	Red	Check that the IDU/ODU cable is properly wired and connected.	
ODU	Red	Check that the IDU/ODU cable is properly wired and connected.	
	Orange	Complete the installation procedure from the Link Manager	
AIR I/F	Red	Check the antenna alignment. Check that the radio configuration of both site A and site B units are the same (Channel and Link ID).	
SVC	Orange Red Off	Alarm detected at the Site B interface or Local or Remote loopback Alarm detected at the Site A interface Ethernet only IDU or E1/T1 not configured	
HSS	Red Orange	 HSS not operational due to improper signal detection. This ODU is not transmitting HSS is operational. One of the following conditions apply: This ODU is a master that is generating signals and detecting signals This ODU is a master that is generating signals but detected improper signals This ODU is a client "Continue Tx" but is not detecting signals This ODU is a client "Disable Tx" and is detecting signals from multiple sources All orange cases transmit. 	
STBY	Red Orange	MHS mode Primary, Link state not active MHS mode Secondary, Link state active	

Table 10-7: LED fault indicators

Use the following table to troubleshoot faults in the system:

Table 10-8: System Troubleshooting

Symptom	Remedy
No power	Ensure that power is connected to the IDU
	Ensure that the ODU cable is properly wired and connected
No signal	Complete the installation procedure from the Link Manager
	Check the antenna alignment. Check that the radio configuration of both site A and site B units is the same (channel settings and Link ID)
Weak signal received	Check the antenna alignment, reconfigure the link
	Check the alignment tone sounds the Best Signal sequence

Replacing an ODU

Prior to any action ensure that both ODUs have the same software version. You can see this on the inventory panels for each site.

For Site A, click **Site A** | **Inventory** and note the ODU software version. Repeat this for Site B using **Site B** | **Inventory**.

If either ODU has an old software version, perform a software upgrade. It is important to configure the new ODU identically to the old ODU to avoid configuration mismatches, which will disrupt the link.

An ODU may be reconfigured in several ways.

• Use the backup configuration

If a backup of the configuration is available, restore that configuration using **Site A|Restore**. Recall that backup files are linked to a MAC address. **This won't work for an identical replacement ODU.**

• Manual configuration

The new ODU can be configured manually according to the link configuration. Remember to use the same settings for Link ID, channels, link password, IP addresses, and names.

Restoring Factory Setup

To restore factory setup:

• Use Site Configuration A or B, and then **Operations | Restore Defaults**. Always restore the over-the-air site (B) first.

Online Help

Online help can be accessed from the Help menu on the main window of the Link Manager.

Customer Support

Customer support for this product can be obtained from the local VAR, Integrator or distributor from whom it was purchased.

For further information, please contact the Netronics distributor nearest to you or one of Netronics offices worldwide.

Part 2

Site Synchronization

Chapter 11

Hub Site Synchronization

What is Hub Site Synchronization?

When several units are collocated at a common hub site, interference may occur from one unit to another. NetStream ODU units support the collocation of more than two units at a central site. Like any other RF deployment, the wireless operation is highly dependent on factors such as available frequencies, the physical spacing between radios, other third party interfering radios, and whether other Netronics radios are installed.

HSS does not eliminate the need for careful RF planning to ensure the design will work as planned. See **Chapter 3** for information on installation site survey.

Netronics HSS

The Netronics HSS method uses carries pulses sent to each ODU, which synchronize their transmission with each other. The pulse synchronization ensures that transmission occurs at the same time for all collocated units. This also results in all of the hub site units receiving data at the same time, eliminating the possibility of interference that could result if some units transmit while other units at the same location receive.

Figure 11-1 illustrates interference caused by non-synchronized collocated units.

Figure 11-1: Interference caused by collocated units

Adding HSS removes interference as shown in the next two figures:

Figure 11-2: Collocated units using Hub Site Synchronization (1)

Figure 11-3: Collocated units using Hub Site Synchronization (2)

The units are connected to each other with HSS cables and HSS Distribution Units.

One of the radios in the site is defined as HSS Master and generates synchronization pulses.

The other collocated radios in the site - the HSS Clients, are connected to the HSS Master and synchronize their transmission to the pulses. An HSS Client can be configured to work in one of two modes:

- HSS Client Continue Transmission (HSC-CT): If the unit loses synchronization with the HSS Master, the link remains active. However, without synchronization pulses, it is possible that this unit will cause interference.
- HSS Client-Disable Transmission (HSC-DT): If the unit loses synchronization with the HSS Master, the link is dropped until the synchronization pulses resume. This setting prevents the unit from causing interference.

The remote ODUs that are not located at the hub site, are called Independent Units. Netronics offers two types of HSS:.

» Serial HSS

The Netronics Serial Hub Site Synchronization (SHSS) method uses a cable connected from the master ODU to all collocated ODUs; this cable carries pulses sent to each ODU, which synchronize their transmission with each other. SHSS is covered in **Chapter 12**.

» Ethernet HSS

The Ethernet HSS (EHSS) method requires Layer 2 Ethernet connectivity between col-located ODUs. It has two requirements:

- Collocated ODUs providing Ethernet services only, should be connected to an IDU-DT6 instead of regular PoE devices. Other simple switches may work with degraded performance. They are not recommended and problems arising from their use will not be eligible for any kind of support.
- Collocated ODUs providing E1/T1 services should use an IDU-NetStream RM or DT and then be connected to an IDU-DT6 functioning as a switch. One of the LAN ports on the IDU-NetStream RM or DT is connected to any of the six IDU-DT6 PoE ports or the two LAN ports. (This is possible because the IDU-NetStream RM or DT LAN cable only uses four pins for data; the power pins are not used so there is no risk of damage to them.) In this way, up to eight such ODUs may be collocated.

You may only use one IDU-DT6. That is, they may not be cascaded.

If you are fusing an IDU-GBE it must be connected to the IDU-DT6 LAN port only. Connecting it to the POE ports will damage the unit and in any event, it will not work.

HSS Concepts: Radio Frame Pattern (RFP)

A Radio Frame Pattern (RFP) is the cycle duration of transmit and receive of the air-frame.

Without HSS

When selecting TDM or Ethernet services, the system automatically and transparently chooses the optimal RFP. When TDM and Ethernet services are configured, the RFP is optimized for TDM.

RFP and HSS

When HSS is used, the RFP for the collocated radios must be selected manually.

NetStream uses the Time Division Duplex (TDD) mechanism.

Under HSS, TDD enables synchronization of transmission for the collocated units as shown in **Figure 11-4**:

Figure 11-4: Radio Frame Pattern

Two RFP types (labelled B and E) are available. Under HSS the RFP must be configured by the user depending on the type of the radio products, services and channel bandwidth in accordance with Table 11-2.

The table describe the efficiency of the air interface according to the RFP type, services and channel bandwidth. The tables may also be viewed in the Link Manager and in the Link Budget Calculator. The efficiency of the air interface will vary according to the product used.

Table 11-1: Radio Frame Pattern Table – NetAstra AU

RFP 5/10/20/40 MHz TDM Ether		Hz
		Ethernet
E	N/A	Best fit

	Table 11-2: Radio	Frame Pattern	Table - NetStream
--	-------------------	---------------	-------------------

RFP	40 MHz		20 MHz		10 MHz		5 MHz	
	TDM	Ethernet	TDM	Ethernet	TDM	Ethernet	TDM	Ethernet
В	Available	Available	Available	Available	Available	Available	Best fit	Best fit
E	Best fit	Available	Available					

Item	Description
Best fit	Optimal RFP choice for TDM and Ethernet services
Available	Available RFP for TDM and Ethernet services, but not optima
N/A	Service unavailable

Select the RFP that gives you the **Best Fit** or **Available** for required system services and select the channel bandwidth accordingly.

The RFP must be the same for each link within the collocated system.

RFP: General Radio Frame Pattern

When setting the RPF, the following considerations should be borne in mind:

- Selection of the RFP influences the capacity, latency and TDM quality
- RFP influences capacity and latency. Jitter buffer configuration can be used to set the TDM quality (see the User Manual, Chapter 6, TDM Services selection)
- Using the Link Budget Calculator, you can see the affect of the RFP on the Ethernet throughput.

RFP: NetStream Considerations

- The performance of NetStream radios that operate with RFPs B or E can be seen in the Link Budget Calculator.
- For NetStream 5x200 series: If the HSS Master works in asymmetric Tx/Rx ratio, then all other collocated NetStream units must operate in the same Tx/Rx ratio. In this case the ratio will be fixed and not automatic-adaptive.
- Installation/Configuration considerations: If you are using NetStream 5x200 master and NetStream clients, the Services and Rates dialog will look like this:

Link Installation	n Wizard	
Services Select	the Services and F	Rate from the lists below.
Service	TDM Jitter Buffer Services Rate [Mbps] Distance smission Ratio	Hot Standby Ring Ethernet QoS Ethernet Configure Adaptive 0 Km / 0 Miles B 100% 50.0% / 50.0%

Figure 11-5: Services and Rates - NetStream HSM and HSC

• The circled areas should not be used. Using those areas, you may loose the collocated link with the longest distance between sites. If you do move the slider into a circled area, you will receive a popup warning:

k Configuration Wizard	
Services Select the Services and	Rate from the lists below.
Service Ring Etherne	t QoS
Services	Ethernet Configure
Rate [Mbps]	Adaptive
Distance	0 Km / 0 Miles
Transmission Ratio	
A	Links operating at a channel bandwidth of 5MHz will be temporarily disabled
0	100%
	70.5% / 29.5%

Figure 11-6: Services and Rates – NetStream HSM and HSC - Extreme asymmetric allocation

By restricting one direction into the restricted area, the more distant sites may not even be able to sustain the link much less send or receive data.

• Asymmetric Allocation and Collocation: If the link is collocated, the use of Asymmetric Allocation is limited.

The effective available range for Asymmetric Allocation (between the two circled tick in Figure 11-5) is primarily determined by three factors:

- The RFP in use (B or E)
- Channel Bandwidth
- Link distance
- Whenever Asymmetric Allocation is available, it is static for all traffic conditions
- Possible scenarios are shown in Table 11-4. (References to NetStream 5x200 apply to NetStream 5x50)

Table 11-4: Asymmetric Allocation with Collocated Links - Scenarios

Scenario: If you try to	Result		Remarks
Change master to asymmetric allocation	•	Releases prior to 2.4 - Link down Release 2.4 and later (NetStream 5x200 and NetStream 5x20 series) - TDM services stopped, link set to transmission ratio of master	Release 2.4 and later (NetStream 5x200 and NetStream 5x20 series) - Asymmetric Allocation slider visible but cannot be changed
Change client to asymmetric	Asymme not disp	etric Allocation slider layed	You cannot do this!

RFP: NetAstra Base Station Considerations

Recall that for collocation purposes, a NetAstra Base Station behaves like a NetStream 5x200 unit. Where one or more Base Stations are collocated with NetStream unit, it is recommended that the NetStream be used at the HSM. You can only use RFP E when collocating mixed product types.

HSS Status LED on the IDU-NetStream RM and DT

The IDU-NetStream RM and DT have a front panel HSS status LED:

	Table 11-5: IDU-NetStream	RM and DT Front	Panel LEDs for HSS
--	---------------------------	-----------------	--------------------

Color	Function				
Green	This ODU is HSS master, generating signal, and HSS Sync is OK				
Blinking Green	This ODU is a HSS client and in Sync				
Red	HSS not operational due to improper signal detection. This ODU is not transmitting				
Orange	 HSS is operational. One of the following conditions apply: This ODU is a master that is generating signals and detecting signals This ODU is a master that is generating signals but detected improper signals This ODU is a client "Continue Tx" but is not detecting signals This ODU is a client "Disable Tx" and is detecting signals from multiple sources All orange cases transmit. 				
Off	HSS is not activated HSS is not supported (NetStream 5x36 and 5x06 only) Disconnection between ODU and IDU				

HSS Error Notification

In the event of an HSS installation fault, the ODU will sound a beep pattern according to the following chart, also printed on the ODU product label:

Figure 11-7: ODU beep for HSS Error

For this purpose, ODU buzzer must be set to Auto or On.

Serial Hub Site Synchronization

Netronics Serial HSS

The Netronics Serial Hub Site Synchronization (SHSS) method uses a CAT 5e cable connected from the master ODU to all collocated ODUs; this cable carries pulses sent to each ODU, which synchronize their transmission with each other.

Since the SHSS unit is still shown in the Netronics Catalog as an "HSS unit", in the remainder of this chapter we will continue with this convention on the clear understanding that we are dealing only with SHSS.

Hardware Installation

Connecting an HSS Unit

A single HSS unit supports up to ten collocated ODUs. In addition to each unit being connected to its IDU or PoE device, the collocated unit has an additional cable that is connected to the HSS Unit. The HSS Unit is a compact, weatherproof (IP67) connector box that is installed on the same mast as the ODUs. All collocated units connect to this box using CAT-5e cable. Cables in prepared lengths are available for purchase.

The HSS unit is supplied with ten protective covers; any port not in use must be closed with a protective cover.

Figure 12-1: HSS Interconnection Unit

- For a single HSS unit, ensure that the collocated units are connected in sequence from SYNC 1. If an ODU is removed from the hub site, then all remaining ODUs must be reconnected to maintain the connectivity.
- You may cascade (daisy-chain) two or more HSS Units with an HSS cable. The method is described in detail below.

To connect an ODU to an HSS unit:

- 1. Unscrew the protective cover from the port marked SYNC 1.
- 2. Connect the RJ-45 connector from one end of the prepared CAT-5e cable to SYNC 1.
- 3. Connect the other end of the CAT-5e cable to the ODU connector labeled SYNC.
- 4. Tighten the protective seal that is on the prepared cable over the RJ-45 connector.
- 5. Repeat for all ODUs that are to be collocated at the hub site. The next ODU to be connected is inserted in SYNC 1, SYNC 2, followed by SYNC 3 and so on.

Using a Single HSS Unit

Figure 12-2: HSS Wiring schematic

The wiring, as shown in Figure 12-2 is self explanatory. The Sync signal path is less self evident. If we set ODU 1 (on SYNC 1) to HSS Master, then the Sync signal path is as shown in Figure 12-3. The signal travels from ODU 1 to SYNC 1, from SYNC 1 to SYNC 2, from SYNC 2 to ODU 2 and back again. The back and forth paths repeat for the second to fourth ODU, from left to right. The signal exits the HSS unit at SYNC 5 and terminates in ODU 5.

The choice of the ODU on SYNC 1 as HSS master is not mandatory, but is good practice. If for example we were to use ODU 3 as HSS master, the Sync signal path would be ODU 3 to SYNC 3, then left and right to SYNC 2 and SYNC 4. It would then propagate to ODUs 2 and 4, terminating at both ODUs 1 and 5.

Figure 12-3: HSS sync signal path with ODU 1 as HSS Master

Using More than One HSS Unit

In a large collocation site, several HSS units may be cascaded (daisy-chained) subject to the following conditions:

Condition 1: Cabling Sequence

- Up to nine ODUs may be connected to the first HSS unit using HSS ports SYNC 1, SYNC 2, SYNC 3,... up to SYNC 9 in order without leaving empty ports.
- 2. The next available SYNC port of the first HSS unit should be connected to SYNC 10 of the second HSS unit as shown in Figure 12-4. In the illustration, the next available port on the first HSS unit is SYNC 6.
- 3. The second HSS unit may be filled out with up to nine more ODUs in **reverse** order. That is, connect SYNC 9, SYNC 8, SYNC 7... as shown in Figure 12-4.

Figure 12-4: Cascading two HSS units

4. To add a a further HSS unit: Connect the next available SYNC port from the second HSS unit in **descending order** (SYNC 5 in Figure 12-4) to SYNC 1 of the third HSS unit.

5. ODUs are connected to the third HSS unit from SYNC 2 as shown in **Figure 12-5**, in **ascending order**:

Figure 12-5: Cascading three HSS units

6. If further ODUs are required, observe the convention that additional even numbered units are populated in **descending order** from SYNC 9 and odd numbered HSS units are populated in **ascending order** from SYNC 2.

If an ODU is disconnected from an HSS unit, then all remaining ODUs must be moved up or down to maintain the connectivity.

Condition 2: Total HSS Cable Length

The total path of the HSS sync pulse must not exceed 300 m. This applies no matter how many HSS units are used. To illustrate the method for calculating the sync pulse path length we show three examples. For our purpose, let:

 L_{mn} denote the length of the ODU-HSS unit cable at SYNC n on HSS unit m H_m be

the length of the cable joining HSS unit m to HSS unit m+1

One HSS unit with five collocated ODUs

 $PathLength = L_{11} + 2 L_{12} + 2 L_{13} + 2 L_{14} + L_{15}$

Two cascaded HSS units as shown in Figure 12-4

 $PathLength = L_{11} + 2 \ L_{12} + 2 \ L_{13} + 2 \ L_{14} + 2 \ L_{15} + H_1 + 2 \ L_{29} + 2 \ L_{28} + 2 \ L_{27} + L_{26}$

Three cascaded HSS units as shown in Figure 12-5

 $PathLength = L_{11} + 2 \ L_{12} + 2 \ L_{13} + 2 \ L_{14} + 2 \ L_{15} + H_1 + 2 \ L_{29} + 2 \ L_{28} + 2 \ L_{27} + 2 \ L_{26} + H_2 + 2 \ L_{32} + 2 \ L_{33} + 2 \ L_{34} + L_{35}$

Figure 12-6: HSS Settings: Left - client, Right - master

The Synchronization Status dialog box displays the current status of each side of the link.

- Operation: Type of unit
 - Hub Sync Master (HSM)

- Hub Sync Client Disable Transmission (HSC-DT)
- Hub Sync Client Continue Transmission (HSC-CT)

Continue Transmission is intended to work if there is no HSM pulse. If a wrong HSM pulse is detected, a Wireless Link will resync, adapting to the HSM RFP and continue whereas NetStream may stop.

- Independent Unit
- Synchronization:
 - N/A- for Master or Independent Units
 - Synchronized for Hub Site Clients
 - Not Synchronized for Hub Site Clients
- External Pulses:

Table 12-2: External Pulse Status

HSS Sync Status	Meaning	Color code
Generating	ODU is HSM and generates the sync pulse	
Detected	ODU is HSC and detects the sync pulse	Green
Not detected	ODU is independent	
Generating and detected	HSM, but other HSM present	
Generating and Improperly Detected	NetStream ODU is HSM, but detects a HSM signal that is not RFP E	Orange
Not detected	HSC but no HSM present	
Improperly detected	HSC but HSM pulse doesn't fit the HSC as configured. ODU stops transmitting.	Red

To configure the Operational States of the Hub Site unit

- 1. Click the **Enabled** check box
- 2. Click the **Configure** button

The Hub Site Configuration dialog box with the current status of the ODUs is displayed.

- 3. Select the type of unit configuration from the drop-down list.
- 4. Select the appropriate RFP radio button. Some RFP options may be disabled depending on the bandwidth previously selected.

Take care to avoid incorrect configuration of bandwidth, RFP or to set multiple Hub Sync Masters, as system interference can occur. Link Manager provides error messages and tool tips if the system is configured with mismatches.

Ethernet Hub Site Synchronization

Netronics Ethernet HSS

Ethernet HSS Requirements

The Netronics Ethernet Hub Site Synchronization (EHSS) method provides intra-site synchronization without the need for external cables or an HSS unit. Sync signals are exchanged between collocated radios over the regular Ethernet connection.

The Ethernet HSS (EHSS) method requires Layer 2 Ethernet connectivity between collocated ODUs. It has two requirements:

- Collocated ODUs providing Ethernet services only, should be connected to an IDU-DT6 instead of regular PoE devices. Other simple switches may work with degraded performance. They are not recommended and problems arising from their use will not be eligible for any kind of support.
- Collocated ODUs providing E1/T1 services should use an IDU-NetStream RM or DT and then be connected to an IDU-DT6 functioning as a switch. One of the LAN ports on the IDU-NetStream RM or IDU-NetStream DT is connected to any of the six IDU-DT6 PoE ports or the two LAN ports. (This is possible because the IDU-NetStream RM or IDU-NetStream DT LAN cable only uses four pins for data; the power pins are not used so there is no risk of damage to them.) In this way, up to eight such ODUs may be collocated.

You may only use one IDU-DT6. That is, they may not be cascaded.

If you are using an IDU-GBE it must be connected to the IDU-DT6 LAN port only. Connecting it to the POE ports will damage the unit and in any event, it will not work.

VLAN Tagging should not use the VLAN ID used by EHSS and vice versa.

EHSS Concepts

Sync Frames

Sync frames are exchanged between collocated ODUs using Layer-2 broadcasting.

Domain

To prevent network flooding, each group of collocated ODUs is configured with an internal "domain name". The default name must be changed to prevent sync frames being received over the LAN by another ODU, which could be then mistakenly configured as a client of an HSM at the wrong location.

Discovery

Discovery by the HSM and HSCs is provided using the following choice of filters:

Discovery Options	
	Al
	HSS Masters only
	My domain only
	My domain HSS masters

Using discovery at the HSM, you can select only those HSCs in the HSM's domain; when configuring a new HSC you may use discovery to pick the correct HSM.

VLAN

VLAN is used to separate sync frames from traffic so as to give sync frames highest priority. If you have collocated ODUs running close to full capacity, failure to do so, would result in excessive jitter and dropped traffic frames.

By default, the VLAN ID 1997 and priority 7 are reserved for HSS. You may change the VLAN ID but not the priority.

Installing Collocated EHSS ODUs

Ethernet Services Only

Use an IDU-DT6 for the collocated ODUs instead of separate PoE devices. The IDU-DT6 has two LAN ports, one of which will be connected to a switch.

Ethernet and TDM Services

To attain Layer 2 connectivity for up to two such ODUs, you should connect one of the two the IDU-NetStream RM (or IDU-NetStream DT) LAN ports to the IDU-DT6 LAN ports. You may use the second IDU-NetStream RM (or IDU-NetStream DT) LAN port to connect to a switch. As pointed out earlier, you may only collocate two ODUs in this way.

Link Configuration and EHSS

The Hub Site Synchronization Settings dialog box appears in both the Link Installation and Configuration Wizards. To illustrate EHSS configuration, we will use two NetStream 5x200 links set up as in Table 13-1:
Table 13-1: Link settings to demonstrate EHSS

Parameter		Link Na	ame	
	Link	1	Lir	nk 2
Operating band (by ACS)	5.745 GHz		5.825 GHz	
Site Name	A1 B1		A2	B2

Figure 13-4: Site Configuration: EHSS - Top - client, Bottom - master

The Details button in the (bottom) HSM window offers a list of collocated clients.

Mixing EHSS and SHSS enabled ODUs

ODUs using both HSS styles may be collocated as follows:

- > To collocate EHSS and SHSS ODUs:
 - 1. Ensure that the EHSS master also supports SHSS. (It will have a Sync port.)
 - 2. Connect the EHSS Sync port of the EHSS master to the first port of the HSS unit.
 - 3. Configure the EHSS master to support both Serial and Ethernet HSS as shown:

Protocol Serial and Ethemet	
Ethemet P Serial Ethemet	
Domain na Serial and Ethemet	
VLAN ID 1997	
VLAN Priority 7	Start Discovery

4. Ensure that all other collocated ODUs are configured as clients as described above (EHSS) and in Chapter 12 (SHSS).

Chapter 14

Using GSU

What is it for?

The GPS-based synchronization unit (GSU) is designed to handle inter-site interferences under large-scale deployment scenarios.

The GSU is an outdoor unit consisting of a small size enclosure, a GPS antenna and a PoE device.

The GSU is connected to the HSS Unit using a standard HSS cable. It synchronizes the transmission timing of multiple Hub-Sites to the same clock source thus eliminating mutual interference.

GSU Functionality

The GSU receives a synchronization signal from the GPS once per second. It distributes a Netronics proprietary synchronization signal to all other ODU units using the RS422 protocol and the standard HSS mechanism, where the GSU acts as an HSM unit.

When the GSU doesn't receive a synchronization signal from the GPS for 30 seconds, it moves automatically to Self-Generation mode and acts as a regular HSM unit, until the GPS recovers.

Typical GSU Scenarios

Independent Distributed Sites

In the scenario of Figure 14-1, we have multiple independent collocated sites, which may interfere with each other. To meet this situation, we coordinate all of them using the GSU as shown.

The GSU functions like "wide area HSS unit", ensuring that all participating radios at the locations marked **GSU** each transmit and receive at the same time.

Figure 14-1: GSU Scenario - Independent distributed sites

Multiple Distributed Sites with Communication

What happens if, in **Figure 14-1**, the GSU towers themselves have radios communicating as shown in **Figure 14-2**?

Consider GSU 1 and GSU 2: Both collocated towers transmit and receive simultaneously. However, the radios communicating at GSU 1 and GSU 2 must transmit and receive in turn according to the scheme in marked "Normal Phase" in Figure 14-3. This is an impossible situation, if all the links must send and receive together. It is further complicated by adding a third and further sites as shown.

Figure 14-2: GSU Scenario - Communicating distributed sites

Cascaded Sites using Shifted Phase Transmission

The solution offered here is not a "universal cure". The following conditions are necessary, but in any specific case may not be sufficient:

- The GSU sites (marked 1, and 3 above) are sufficiently far apart as to ensure that there is no mutual interference between communicating sites (1-2 and 2-3 above)
- There should be no interference between non-communicating sites (1 and 3 above).

To see how it works, we use Figure 14-2. The GSU towers are numbered and marked for cascading, 1-2 and 2-3. There should *not* be a link between 1 and 3.

The GSU can synchronize the TDD timing of several sites enabling the cascading of consecutive links without mutual interference.

To use cascading, the TDD timing of the even-ordered links (GSU 2 above) must be "shifted" (Shifted Phase) and odd-ordered links (GSU 1 and GSU 3 above) must be "un-shifted" (Normal Phase). The phase shift is half of the Radio Frame Duration (RFD) from the chosen RFP. The scheme is shown in **Figure 14-3**.

Since the GSU is always HSS master (HSM), at each GSU location, the GSU can "force" the synchronization of its collocated radios. By half RFD shifting, alternate collocated sites can talk to each other.

Figure 14-3: Phase shifted transmission - phase shift is 1/2 the RFD

Choice of normal or shifted phase is configurable per GSU using the Link Manager.

GSU Redundancy

The GSU is designed to support redundancy, improving the robustness of a GSU based topology.

In redundancy mode, two GSUs are installed at the same HSS site. One of them self configures to generate HSS sync signals. We will call it the Primary unit. The other one, the Secondary unit remains dormant merely polling the first GSU. If the Primary GSU fails, then the Secondary GSU becomes active immediately. If the Primary unit becomes active again, it remains dormant, reversing the original roles. The choice of the Primary GSU is random and of no significance.

If the Primary GSU fails, and then the Secondary GSU also fails to receive sync signals from its GPS, then it moves to self generation HSM mode like an ordinary HSM ODU until its GPS recovers.

Figure 14-4: Make the GSUs the first two collocated units Redundancy switching is completely transparent to the GSU-managed links.

GSU Kit Contents

The GSU package includes:

- 1 x GSU
- 1 x Mounting Kit
- 1 x GPS Antenna
- 1 x GPS Antenna Mounting Kit
- 1 x RF Cable, 1.5 m
- CD

GSU Installation

Overview

Figure 14-5: General GSU configuration

It may be configured using the regular Link Manager or Telnet.

Preparing the GSU for Use

Log on to the unit using Local Connection or IP address 10.0.0.120 to change its IP address from the default (10.0.0.120). In the example screen captures below, we use 10.104.20.1 with Subnet Mask 255.255.0.0 and Gateway 10.104.10.21.

Mounting the GSU

Mount the GSU and antenna. Ensure that its ODU port connected to its PoE device and the HSS cable is connected to the HSS unit as shown. The external LAN port of the PoE device is connected to the managing computer. If you are accessing the GSU through a network it is essential that you use the IP preloading method. The default IP address may be inaccessible and you may not use the Local Connection method over a network.

Configuring the GSU

Getting Started

To configure the GSU, you log on to it, exactly as in Chapter 5.

The GSU Main Window

Here is the main window for GSU configuration:

🔧 Link Manager	(Operator)							000
File Configuration	Tools Maintenand	te Help ک Site: Location	Site2	Get Diagnostic	s <u>C</u> léar Counters	K Log Off	elp(F1)

Figure 14-6: GSU Main widow at startup

The top five items in the GSU Monitor panel are taken from a satellite. The transmission Phase may be **Normal** as shown or **Shifted**. It purpose, together with the **Tx Ratio** bar, will be explained below.

The Status Box

Under normal operating conditions, it will be green as shown, indicating that it is synchronized with a satellite.

Generating Synchronization Pulse

If satellite synchronization is lost, then the GSU will function as an independent HSM and the status box will change color:

Generating Synchronization Pulse

The Main Menu

The main menu is a subset of the main menu applicable to the NetStream. Notice that there are no Installation or Configuration wizards. Such configuration as is necessary is carried out using a modified version of Site Configuration for Wireless Link.

Similarly, the Tool bar is a subset of that applicable to the Wireless Link.

Using Site Configuration for the GSU

Site Configuration: System

Here is the opening window for **Site Configuration**:

Figure 14-7: Site Configuration: System

Site Configuration: GPS Sync Unit

This window is the main GSU configuration tool:

Figure 14-8: Site Configuration: GPS Sync Unit (WBB-R for NetStream 5x36 and 5x06 while WBB-B for NetStream 5x200, 5x50, 5x25 and 5x10)

1. Setting the RFP for HSS

The GSU is automatically configured as HSS Master (HSM).

Ensure that no other collocated ODU is configured as HSM.

If the hub site consists only of NetStream 5x36 and 5x06 units, then any suitable RFP may be chosen. If there are one or more NetStream units, you must use RFP B or E.

The permitted RFPs are also dependent on channel bandwidth and are color coded as follows:

There is a further restriction: If there are two distributed sites transmitting to each other, they must both use the same RFP. This requirement, together with use of shifted transmission phase (item 3 below), ensures that communicating distributed sites to not interfere with each other by transmitting simultaneously.

Two GSU managed sites transmitting with shifted transmission phase and using the same RFP, transmit one half a RFD apart (see Figure 14-3 above).

2. Setting the Tx Transmission Ratio

Since the GSU is always HSM, it must be able to cater for hub site NetStream 5x200 based links. (See the NetStream User Manual, Chapter 5). If you use asymmetric allocation, shifted transmission phase becomes unavailable and you cannot "cascade" links as described in step 1.

3. Choosing the Transmission Phase

Chose the Transmission Phase in accordance with considerations in step 1 above. If you choose Shifted Phase then the Asymmetric Ratio selector is disabled.

You may choose the units for latitude/longitude coordinates.

GSU Monitoring and Diagnostics

The monitoring and diagnostic reports are similar to those of NetStream 5x36 and 5x06.

GSU Telnet Support

To configure the GSU with Telnet, start a Telnet session, using

telnet <GSU_ipaddr>.

For example, if you run Telnet as follows,

telnet 10.104.20.1

you will be asked for a user name and password. You must log on with administrator privilege under user name, *admin* and password *netman*.

The available commands are the same as for NetStream 5x36 and 5x06 with the addition of four additional display commands and three additional set commands.

The additional display commands are

display rfp

The rpf value displayed is anindex from 2 to 6, 2 for A, 3 for B and so on.

display ratio

display tx_phase

display gpsinfo

The last one **display gps info**, is the most interesting:

admin@10.104.20.1-> display gpsinfo

Current GPS time	102941.000
Current GPS latitude	51.500000
Current GPS N\S Indicator	Ν
Current GPS longitude	0.000000
Current GPS E\W Indicator	E
Current GPS number of satellites	09
Current GPS altitude	84.0

Command "display gpsinfo" finished OK.

The three additional set commands are set

rfp <index> (2-6) set ratio <ratio> set tx_phase <mode:1=normal,2=shifted>

Software Update for GSUs

All GSUs in a distributed site can be updated simultaneously. Use an IP list as described in **Chapter 17**.

Part 3

Advanced Installation

Monitored Hot Standby Installation Procedure

What is a NetStream Monitored Hot Standby

The NetStream Monitored Hot Standby (MHS a.k.a 1+1) is a duplicated link set up as a primary link and a secondary link in hot standby mode as shown in Figure 15-1 below.

Figure 15-1: NetStream Monitored Hot Standby

NetStream MHS provides redundancy and backup to TDM services. It is designed to provide high reliability high capacity Point-to-Point links. The NetStream MHS is -

- Designed to provide redundancy and high reliability for carrier class operators
- Optimized for high capacity links operating in license free bands
- A comprehensive solution providing protection against both equipment failure and loss of air interface, by simple connectivity between a primary link and a secondary link

The main service redundancy features of the NetStream MHS are -

- TDM service cut-over from the primary to the secondary link is completely automatic
- TDM service cut-over time no more than 50 ms
- Automatic restore to primary link as soon as it becomes available
- Support for up to sixteen TDM channels for NetStream

MHS is supported between two NetStream links using IDU-NetStream RMs. In what follows, ODU refers to a NetStream radio and IDU refers to an IDU-NetStream RM.

What NetStream MHS provides

Equipment Protection

Equipment protection is provided for the electrically-active network elements, ODU and IDU.

The primary IDU and the secondary IDU are connected by a cable to monitor failure and to control protection switching. Switching time is less than 50 ms.

Air-Interface Protection

Air-Interface protection is unique to NetStream and is optimized for wireless links operating in license free bands.

The primary link and the secondary link use different frequency channels. If the air-interface of the primary link is disturbed and cannot carry the required TDM service, then the system automatically switches to the secondary link.

In addition, improved robustness and frequency planning flexibility is achieved, as the primary and secondary air interfaces can operate in the same frequency band or in different frequency bands.

Automatic Channel Selection (ACS) can be configured for each link to add additional robustness.

The primary and secondary links are synchronized using Hub Site Synchronization (HSS).

It is recommended that both sites be installed with HSS cables. If HSS fails at one site, it can be operated from the other site by remote configuration.

Purpose of this Chapter

This chapter is an installation and maintenance guide for NetStream MHS. It applies to all NetStream radio products able to support the Monitored Hot Standby operational mode.

Who Should Read this?

This chapter is intended for persons responsible for the installation and maintenance of NetStream MHS. To use it you need to know how to -

- Install a NetStream radio link
- Use the Link Manager software

NetStream MHS Kit Contents

- One Y-Connection Patch Panel
- One MHS cable

Figure 15-2: NetStream Y-Connection Patch Panel

Installing a NetStream MHS

The following procedure is substantially generic to all Netronics radio products. What you see on your running Link Manager may differ in some details from the screen captures used to illustrate this chapter.

Figure 15-1 above is a schematic of a NetStream MHS. **Figure 15-3** shows how to connect the IDUs to the Patch Panel.

		To user equipment

Figure 15-3: How to connect the IDUs to the Patch Panel

- With NetStream links you can protect up to 16 TDM ports. To protect more than eight TDM ports use two Patch Panels at each site.
- Ethernet services are carried independently by primary and secondary links. Each link carries different Ethernet traffic. MHS does not protect Ethernet traffic.

In what follows, it will be assumed that -

- 1. We will depart from our usual Site A / Site B conventions. Sites A and B on the primary link will be Sites 1.2 and 1.4 respectively. The corresponding sites on the secondary link will be Sites 2.2 and 2.4. The site names reflect their IP addresses. This is a useful convention and is reflected in the screen captures below.
- 2. The link will be managed from Site 1.2; Site 1.4 may be a remote site.
- 3. The links intended as the primary and secondary will be referred to their respective names, Primary Link and Secondary Link as shown in Figure 15-1 above, despite their having yet to be installed.

To install a Hot Standby Link:

1. Set up Primary Link in the usual way. Ensure that it is fully operational in accordance with the relevant instructions in Part 1 of the User Manual.

Do not proceed unless this condition is fully met!

- 2. Connect user equipment to Site 1.4.
- 3. At Site 1.2, disconnect the TDM cables from the external equipment or disconnect external equipment from the Hot Standby Patch Panel.
- 4. The HSS cable (connecting the ODUs) should be connected at Site 1.2. The ODU belonging to the primary link should be configured as HSM, whereas the ODU belonging to the secondary link should be configured as HSC-CT.
- 5. Establish Secondary Link in the usual way, with HSS enabled. The two link frequencies should be at least 5 MHz apart.

- 6. Connect the MHS cables at Sites A and B as shown in Figure 15-1 and Figure 15-3 above.
- 7. Run the Configuration Wizard for Primary Link. Activate TDM services in the usual way. Navigate to the **Hot Standby** tab, in the Services Configuration panel:

Link Configuration Wizard	
Services Select the Services and Rate.	
Service TDM Jitter Buffer Hot Standby Ring Ethernet QoS	
Mode: Primary Oscondary Disabled Image: I	
	Evaluate

Figure 15-4: Services Configuration Panel: Hot Standby mode selection

Check the Primary button to configure Primary Link as the primary link.

- 8. Complete the Wizard, and then move to Secondary Link.
- 9. Repeat step 7 for Secondary Link. For the Services Hot Standby tab, this time, check the Secondary button.
- 10. Complete the Wizard.
- 11. At Site 1.2, reconnect the Hot Standby Patch panel to the external equipment. From this point on, we will simply refer to primary and secondary link (no capitalized names). At the end of the process, the Link Manager main windows should look like this:

Installing a NetStream MHS

Installing a NetStream MHS

To see what happens following a cut-over from the primary link to the secondary link, you need to have running two copies of the Link Manager – one logged into the primary link, and one logged into the secondary link.

Here then, is the situation after a cut-over to the secondary link:

For the primary link, the following window will appear for a few seconds:

Figure 15-7: Primary link a few seconds before regular No-Link display

It will then revert to the standard No-Link-available window.

On the secondary link Manager window, you will see a window like this:

Maintaining a NetStream MHS Link

Maintaining a NetStream MHS Link

IDU Replacement

There are two situations, which must be treated differently.

Situation 1:

To replace either of the IDUs at Site 1.4 or the IDU at Site 2.2, nothing special is required. Simply disconnect the IDU to be replaced – and replace it with a new one. Replacing a secondary link IDU obviously has no effect on the TDM service. Disconnecting the Site 1.4 primary IDU activates Hot Standby. After the Site 1.4 primary IDU is replaced, the Link will detect the change and switch back to the primary link.

If you replaced the Site 2.2 IDU, remember to reconnect the MHS cable.

Situation 2:

Replacing the Site 1.2 IDU is different, and requires several steps.

To replace the Site 1.2 primary link IDU:

1. Power off the Site 1.2 IDU. This activates the secondary link using Hot Standby.

- 2. Run the Configuration manager on the secondary link, and in the Hot Standby panel of Figure 15-4 above, check the Disabled button.
- 3. Replace the Site 1.2 IDU without connecting it to the ODU (to prevent transmission by the primary link with the undefined IDU).
- 4. Reconnect the MHS cable between the IDUs at Site 1.2.
- 5. Again, run the Configuration Wizard on the secondary link, and in the panel of Figure 15-4 above, check the Secondary button to re-enable the link as secondary.
- 6. Connect the new Site 1.2 IDU to its ODU.

The Hot Standby will automatically revert to the primary link within 50 ms.

ODU Replacement

Both the primary and secondary replacement ODUs require pre-configuration prior to insertion into the link. The items to be pre-configured are

- HSS mode
- Link ID
- Frequency
- Hot Standby mode using the new Services panel in Figure 15-4 above
- IP address (optional)

Pre-configuration must be carried out before the new ODU is connected to its IDU. If you try to do it "live" against its IDU, it will cause spurious transmissions and a service break.

> To pre-configure an ODU:

- 1. Attach the new ODU to an IDU or a PoE device.
- 2. Run the Link Manager and use Hot Standby tab of Figure 15-4 above to configure the new ODU to Primary or Secondary mode as required.
- 3. Ensure that it is set to the proper HSS mode in accordance with Figure 12-4 above. Enter the required Link ID and frequency.

To replace an ODU for primary or secondary link, at either site:

 Install the pre-configured ODU. (Since the other link is working normally, nothing need be done with it. If the secondary ODU was replaced, TDM service remains as is on the primary link. If the primary ODU was replaced, then the TDM service will shift back to the primary link.)

Switching Logic

Switching from Primary Link to Secondary Link

Switching from primary link to secondary link will occur following:

• Loss of the primary air interface due to sync loss
Switching Logic

- Loss of the primary air interface due to failure of the receiver to acquire expected E1/T1 data during a period of 24 ms
- The Primary equipment (either ODU or IDU, local or remote) is powered off

Following the switch from the primary to the secondary link, the primary and secondary link Manager main windows should look like this:

Figure 15-11: Primary link operating after the switch back from secondary

Figure 15-12: Secondary Link operating after the switch back to Primary

System Operation description

Normal operation	 TDM services are carried by the primary link The secondary link (equipment and air interface) is operating but not carrying user traffic TDM ports on the secondary IDUs are tri-state 			
Switching to backup	 Switching to secondary will occur in the following cases: Loss of the primary air interface due to sync loss Loss of the primary air interface due to failure of the receiver to acquire expected TDM data during a period of 24 ms Primary equipment power off (either ODU or IDU, local or remote) The switching result would be: TDM ports on the primary IDUs turn to tri-state TDM ports on the secondary IDUs become active 			
Backup operation	• TDM services are carried by the secondary link			
Switching back to primary	Switching back to primary will occur as soon as the Primary link is fully functional for 1 second			

The Ethernet Ring

Scope

The description of NetStream Ethernet Ring in this Chapter is completely generic: NetStream links may participate in an Ethernet ring.

VLAN IDs are used by Netronics products in three separate contexts: Management VLAN, Traffic VLAN and Ethernet Ring. It is recommended that you use different VLAN IDs for each context.

What is an Ethernet Ring

An Ethernet ring consists of several nodes connected by hops (links). Loops are not allowed with Ethernet; therefore one hop is a **Ring Protection Link** (RPL) which "blocks" Ethernet traffic. In the event of failure in the ring, the Ring Protection Link unblocks and Ethernet traffic in the ring is restored.

Some terminology:

- Normal State all member links are functional except the RPL which is blocked.
- **Blocked** the air link is up but Ethernet traffic is not transmitted across the link. The Ethernet service panel for the RPL in the Link Manager is labelled **Idle**
- **Unblocked** Ethernet traffic is transmitted across the RPL. The Ethernet service panel for the RPL in the Link Manager is labelled **Active**
- Protection State a member link is broken and the RPL passes Ethernet traffic
- Ring Protection Link as described above
- Ring Link any member link controlled by the RPL
- Independent Link not subject to ring protection
- Ring Protection Message (RPM) control message used to monitor and control the ring.

RPM messages are broadcast, so it is essential (to prevent flooding) to associate the RPL and member Ring LInks with a VLAN ID. This requires in turn, that equipment used in the ring either supports VLAN or can transparently pass through VLAN tagged packets.

NetStream Ethernet Ring

The following figure describes the RPL behaviour during a ring failure and recovery cycle.

Figure 16-1: Ring Protection mechanism

The steps below follow the numbering in Figure 16-1:

1. Normal operation

Ethernet traffic runs in the ring, but does not pass through the RPL, which is blocked. The RPL does however, broadcast RPM packets through the ring.

2. Ring Link down, RPL notified

The RPL detects a link-down condition by the non-arrival of an RPM packet. It remains blocked for the **Minimum time for failure detection** which is configurable using the Link Manager (see page **265**).

3. Ring Link down, RPL unblocked for traffic

The RPL unblocks for Ethernet traffic after the **Minimum time for failure detection** expires and no RPM message has been received.

4. Ring Link restored but still blocked for traffic

The Ring Link is restored, but remains blocked for the **Minimum time for recovery**, set using the Link Manager, to avoid rapid fluctuations leading to potential short term loops (see page **265**).

5. Ring Link restored, RPL blocked for traffic

The RPL blocks to Ethernet traffic after the **Minimum time for recovery** expires and restores Ethernet traffic to the Ring Link (with a special RPM packet).

Return to 1.) Ring Link restored, RPL blocked for traffic

The ring is back to normal operation.

With NetStream links, NetStream Ring Protection solution prevents Ethernet loops in the ring at all times. The ring is always broken somewhere.

- Under a ring configuration a NetStream Ring Link that was down and commences recovery, keeps blocking Ethernet traffic. The RPL identifies this situation, blocks itself and then unblocks the other Ring Link. This is the transition from step 4 to 5 in Figure 16-1.
- If the failed hop is not a NetStream link then there are two possibilities:
 - If the hop Ring Link can signal that it is down by issuing a Loss of Signal (LOS) at the Ethernet port, then the RPL will control the NetStream link connected to that port in the same manner as described above, to prevent an Ethernet loop.
 - Otherwise, there may be a short loop period when the RPL is still open for traffic and the Ring Link is also unblocked during the **Minimum time for recovery**.

Ethernet Ring Topologies Supported by Netronics

The following ring topologies are supported:

Table 16-1: Topologies supported by NetStream Ethernet Ring

Table 16-1: Topologies supported by NetStream Ethernet Ring (Continued)

Protection Switching

Protection switching occurs upon failure in the ring.

The Ethernet service restoration time depends on the number of hops in the ring. With four hops the Ethernet service is restored in less than 50 ms.

In single and dual homed topologies the service restoration may take longer due to the aging time of the external switches. Switches that are immediately aware of routing changes reduce the restoration time.

Hardware Considerations

Ethernet Ring Protection is supported by the IDU-NetStream RM, IDU-NetStream DT and PoE.

A typical Ring Protection Link consists of an IDU-NetStream RM or new style IDU-NetStream DT, a PoE and two ODUs as shown in Figure 16-2. Hence one end of the RPL and of ring controlled links, as shown in Figure 16-2 has to be an IDU. It is recommended to have an IDU at each node to have the flexibility to change the RPL.

A ring node is built from two ODUs from adjacent links. The ODUs can be connected to either an IDU or to a PoE device as in Figure 16-2. Port names in the IDU are shown.

Figure 16-2: Node with IDU and PoE device

Connect the switch at the site only to one IDU.

The switching function is carried out by the IDU-NetStream RMs and IDU-NetStream DTs, both of which provide Layer 2 support (see Chapter 18).

Special Case: 1 + 1 Ethernet Redundancy

The same device may be used to provide economic 1 +1 redundancy for a single link.

A 1+1 Ethernet is a ring with two nodes. One of the links is RPL.

The equipment in a 1+1 Ethernet installation is as follows:

Figure 16-3: 1+1 Ethernet

Figure 16-4: Using IDU-NetStream RM or IDU-NetStream DT with PoEs for the RPL

Notice that link content drops from four PoEs plus two switches to two PoEs and two IDU-NetStream RMs or IDU-NetStream DTs.

Using Link Manager to Set up a Ring

Creating a Ring using Link Manager requires two stages:

- 1. Set up each participating link separately, in the usual way
- 2. For each link, run the Configuration wizard to define it as RPL or a Ring Link

_
-
Note

- The Ring uses a VLAN ID for the RPL. It is used to manage the Ring and nothing else; it is completely separate from the management and traffic VLANs referred to elsewhere
- A regular Ring Link may be a member of up to four rings and each of their RPL VLAN IDs must be configured.

Here then, is step 2 in more detail:

> To integrate a link into an Ethernet Ring:

1. Using either the Installation or Configuration wizards, navigate to the Services window and chose the Ring tab.

Link C	Configuration Wizard	
5	Select the Services and Rate from the lists below.	
	Service TDM Jitter Buffer Hot Standby Ring Ethernet QoS	
	Configure Ethernet Ring Settings Configure	

Figure 16-5: Services window with Ring selected

2. Click **Configure**. The Ring definition window is displayed. The default is Independent Link and is used when the link is not part of any Ring.

C Ring Configuration
Link Mode
Each Ring must contain one RPL Ring Protection Link (RPL) Independent Link Ring Link (non RPL) Ring Protection Link (RPL) Ring Verify that all links are configured with same Ring VLAN ID
Advanced Minimum time for failure detection [msec] 100 束
Minimum time for recovery [sec]
OK Cancel

Figure 16-6: Ring Options

3. To configure the link as a regular Rink link, click **Rink Link (Non- RPL)** and enter the ring LAN VIDs (at least one) to which it belongs and click **OK**:

Using Link Manager to Set up a Ring

Verify that all links are configured with same Rin	ng VLAN ID
Advanced	
Minimum time for failure detection [msec]	00 🜩
Minimum time for recovery [sec]	1
ОК	Cancel

Figure 16-8: Configuring RPL VIDs

5. Enter the minimum times for failure detection and recovery.

For dual homed configurations, where part of the ring goes through the core, if a core segment fails, the core should be allowed to recover before the RPL enters Protection State. Otherwise, it could happen that both the core and the NetStream ring will switch in parallel. You should therefore, configure a **Minimum time for failure detection** high enough to take this possibility into account.

The **Minimum time for recovery** is a delay switch to prevent rapid "on-off" fluctuations. It functions like a delay switch use to protect electrical devices from rapid "on-off" power fluctuations, which in this context, may lead to potential short term loops.

6. Click **OK** to accept your settings.

The RPL will be clearly indicated in the Link Manager. In the Link status area on the top left, you will see an Ethernet (Blocked) notice:

A Link Idle message is displayed on the Ethernet Services Bar:

Ethernet Service: Ring Protection Link	<-Idle 🐧
Estimated Throughput [Mbps]	0
Rx Rate	
Tx Rate	

When the RPL cuts in as a result of a failure, the "Ethernet (Blocked)" notice disappears. The Ethernet Services Bar indicated that the RPL is active:

Ethernet Service: Ring Protection Link-	Active
Estimated Throughput [Mbps]	0
Rx Rate	
Tx Rate	

Upon restoration of the broken link, the RPL returns to idle status with the appropriate indications on the Link Manager main window.

On the status bar for all ring member links, you will see the ring membership indicator icon:

- Do not configure more than one RPL. If you do, you will break the Ring
- If you forget to configure one RPL in a Ring, you will introduce a loop into your network.

Chapter 17

Software Upgrade

What is the Software Upgrade Utility?

The Link Manager provides a Software Upgrade Utility (SWU) to upgrade the software (firmware) of installed ODUs in a network. The update files may be located anywhere accessible by the operator.

The SWU provides for:

- Prior backup of the current files prior to upgrade
- Upgrade from a list
- Delayed upgrade
- Various ODU reset options

The default location of the software files is in the installation area, and can be used to restore factory defaults.

The following procedure is generic to all Netronics point to point radio and GSU products.

Upgrading an Installed Link

> To upgrade software for a link:

1. In the Link Manager main menu, click **Tools | Software Upgrade** ... The following detached window appears

Software Upg Acti File Start Upgrade Software U Availab

vare Upgrade Tool							E
le Actions Help							
t Upgrade Stop Upgrade Add Si	te Clear all Upgrad	Package Save Configuration

TPSF_BTT							
🔊 Direct connecti 10.104	.2.2 A	2.8.00_b2960_Dec 6 2012					
% Air connection 10.104	.2.4 B	2.8.00_b2960_Dec 6 2012					

Figure 17-1: Software Upgrade Utility - Main window

The default sites shown in the Software Upgrade list panel belong to the currently link. The list may be empty if you are running the Link Manager "offline".

What follows about adding sites manually or from a list file, assumes that all sites to be upgraded are of the same type - NetStream radios. This will not work with a mixed list.

2. Click Add Site to add additional sites for upgrade.

Figure 17-2: Add site options

Click Add Single Site for one site only:

🔄 Add Site for Software Up	pgrade
IP Address:	
Read-Only Community :	
Read-Write Community :	
	OK Cancel

Figure 17-3: Adding a single site for upgrade

Enter the IP address of the site, the Community strings (Default: **public** and **netman**, respectively) and then click OK. The site will appear in the Software Upgrade list box.

The list can be cleared using the **Clear All** button.

As an alternative to adding sites one at a time, you can add sites from a prepared list using the **Add from File** option in **Figure 17-2**. The list has the following format:

<IP address>,<Read-Only community>,<Read-Write community>

Here is an example:

10.104.2.2, public, netman

10.104.2.4, public, netman

3. Having created an update list, click **Upgrade Package** to chose the relevant files. The default files are located in the **SWU** subdirectory in the Link Manager installation area. They are currently named **SWU_1k.swu** and **SWU_2k.swu**. You may have to find them elsewhere, depending on your system.

You can only include one type of ODU in a list. That is, you need separate list for NetSream and GSU products.

4. You make limited changes to the list by right-clicking any line:

lame	IP Address	Site Name	Current	Release	Progress	5
TPSF_BTT						
🔊 Direct connecti	10.104.2.2	A	2.8.00_b2	960_Dec 6 2012		
🔏 Air connection	10.104.2.4	В	2.8.0	Remove from list

Figure 17-4: Software Upgrade site options

5. To back up your existing system, check Backup device software check-box. Then

Click the button for a standard file dialog. The default location is the My Documents directory on the managing computer or the last backup directory you used.

The backup here is the same as that in **page 169**, and serves the same purpose. It provides a fallback if the upgrade proves problematic.

- 6. In addition to the previous step, you may opt to perform a delayed upgrade. Check the Delayed Upgrade box, and enter the date and time for the delayed upgrade.
- 7. The radio buttons on the right determines how your sites should be reset. Bear in mind that on the one hand, a reset involves a service interruption, but on the other hand, the software upgrade will not become effective until after the reset is carried out.
- 8. Click **Start Upgrade** to commence the process. For an immediate upgrade you will be able to observe the upgrade progress from the green progress bars:

	👊 Air connection	10.104.2.4	В	2.8.00_b2960_Dec 6 2012		Uploading completed

Figure 17-6: Software upgrade completed successfully

- 9. Click **Close** to exit.
- 10. If you requested a delayed upgrade, a notice like this will appear:

Available Release	2.8.00_b2970_Jan 17 2013	
Description	Release 2.8.00	
Backup device software		
Delayed Upgrade	Date: 01/27/13 Time: 09:40 AM	

If one or both sites fail to update, a warning notice will be displayed.

If one site of a link updates but the other fails, you should correct the problem and update the second site as soon as possible. If you do not, following the next reset of the updated site, you could experience a link software mismatch which may affect service. See page 176 for details.

Software Upgrade for GSUs

All GSUs in a distributed site can be updated simultaneously. Use an IP list as described above.

Chapter 18

VLAN Functionality with NetStream

VLAN Tagging - Overview

VLAN Terminology

Both the technical literature and the Link Manager use the terms VLAN ID and VID interchangeably to denote a VLAN identification number.

VLAN Background Information on the WEB

The standards defining VLAN Tagging are IEEE_802.1Q and extensions.

For general background about VLAN see http://en.wikipedia.org/wiki/Virtual_LAN.

Background information about **Double Tagging** also known as **QinQ** may be found here: http://en.wikipedia.org/wiki/802.1QinQ.

VLAN Tagging

VLAN tagging enables multiple bridged networks to transparently share the same physical network link without leakage of information between networks:

Figure 18-1: Two network using the same link with tagging

IEEE 802.1Q is used as the encapsulation protocol to implement this mechanism over Ethernet networks.

QinQ (Double Tagging) for Service Providers

QinQ is useful for Service Providers, allowing them to use VLANs internally in their "transport network" while mixing Ethernet traffic from clients that are already VLAN-tagged.

Figure 18-2: Separating client data streams using double tagging

The outer tag (representing the Provider VLAN) comes first, followed by the inner tag. In QinQ the EtherType = 0x9100. VLAN tags may be stacked three or more deep.

When using this type of "Provider Tagging" you should keep the following in mind:

- Under Provider Tagging, the system double-tags egress frames towards the Provider's network. The system adds a tag with a VLAN ID and EtherType = 0x9100 to all frames, as configured by the service provider (Provider VLAN ID).
- The system always adds to each frame, tags with VLAN ID and EtherType = 0x9100. Therefore,
 - a. For a frame without a tag the system will add a tag with VLAN ID and EtherType = 0x9100 so the frame will have one tag
 - b. For a frame with a VLAN tag the system will add a tag with VLAN ID and EtherType = 0x9100 so the frame will be double-tagged
 - c. For a frame with a VLAN tag and a provider tag the system will add a tag with VLAN ID and EtherType = 0x9100 so the frame will be triple-tagged and so on

VLAN Untagging

VLAN Untagging means the removal of a VLAN or a Provider tag.

Port Functionality

The VLAN functionality is supported by all LAN and SFP ports in the IDU.

Each port can be configured how to handle Ethernet frames at the ingress direction (where frames enter the IDU) and at the egress direction (where frame exit the IDU).

The configuration is independent at each port.

Ingress Direction

Table 18-1: Port settings - Ingress direction

a. Priority Code Point (PCP) which refers to the IEEE 802.1p priority. It indicates the frame priority level from 0 (lowest) to 7 (highest), which can be used to prioritize different classes of traffic (voice, video, data, etc).

Egress Direction

Table 18-2: Port settings - Egress direction

VLAN Availability

VLAN is available for links using NetStream radios. VLAN support requires the use of IDU-GBEs or IDU-NetStream DTs for NetStream 5x36 and 5x06. For other NetStream you may also use a PoE device and configure ODU VLAN. See **Chapter 9**.

VLAN Configuration Using the Link Manager

VLAN IDs are used by NetStream products in three separate contexts: Management VLAN, Traffic VLAN and Ethernet Ring. It is recommended that you use different VLAN IDs for each context.

If you are **not** a VLAN expert, please be aware that incorrect VLAN configuration may cause havoc on your network. The facilities described below are offered as a service to enable you to get best value from your NetStream links and are provided "as is". Under no circumstances does Netronics accept responsibility for network system or financial damages arising from incorrect use of these VLAN facilities.

Management Traffic and Ethernet Service Separation

You can define a VLAN ID for management traffic separation. You should configure the system to prevent conflicts as detailed below.

When configured for the default operational mode, a "Provider port" will handle ingress traffic as follows:

- Filters frames that are not tagged with the Provider VLAN ID
- Removes the Provider double tag

Therefore, if a port is configured for management traffic separation by VLAN and as 'Provider port', then the received management frames must be double tagged as follows:

- The outer tag has to be the Provider's tag (so the frame is not filtered)
- The internal tag has to be management VLAN ID

To avoid mix-ups, best practice is to:

- Separate the management and data ports
- Define only a data port with Provider function

All IDU-NetStream RM and new style IDU-NetStream DT models have two LAN ports so you can easily separate management and Ethernet service.

VLAN Tagging for Ethernet Service: Configuration

VLAN Configuration is carried out per site. It is up to you to ensure consistency between the link sites. The discussion below is based on Site A however, it also applies to Site B.

See also VLAN Tagging for Ethernet Service: Configuration.

To set up VLAN tagging for Ethernet service, enter Site Configuration for Site A, choose the Ethernet tab and click the **VLAN Configuration...** button (Figure 9-15). The following window is displayed:

VLAN Configuration Using the Link Manager

VLAN Con	figuration	
VLAN W	orking Mode: Normal 🔻	
	Ingress Mode	Egress Mode
	Transparent 💌	Transparent
LAN1	VLAN ID:	
	Transparent	Transparent
LAN2	VLAN ID:	
	Transparent	Transparent
SFP	VLAN ID:	VLAN ID:
		Provider parameters are common to all ports Provider parameters
		VLAN ID: VLAN Priority:
		OK Cancel

If you are using a IDU-NetStream DT, the SFP row will not appear.

Normal and **Membership** modes are different ways of entering VLAN settings and *are described in detail in* **VLAN Tagging for Ethernet Service: Configuration on page 156.** What follows below is a short summary.

The choices for Ingress Mode are -

	Ingress Mode
LAN1	Transparent Transparent Tag VLAN ID: VLAN Priority:

Figure 18-4: VLAN: Ingress modes

The two choices correspond respectively to the two rows of Table 18-1. Choosing Tag causes the VLAN ID and VLAN Priority fields to become available:

	Ingress Mode
	Tag 🔹
LAN1	VLAN ID: VLAN Priority: 0

Figure 18-5: VLAN: Ingress mode - setting VLAN ID and Priority

Throughout this chapter, all VLAN IDs must be between 2 and 4094, inclusive. All VLAN priorities must be between 0 and 6, inclusive. The values entered are range checked. If for example, you enter a VLAN ID of 4095, then 4094 will be reflected back.

The choices for Egress Mode are –

Egress Mode	
Transparent	•
Transparent	
Untag all	
Untag selected VLAN IDs	
Provider tagging	
Provider tagging without filter	
Filtered VLAN IDs	

Figure 18-6: VLAN: Egress modes

The five non-transparent choices correspond respectively to the five rows of Table 18-2 in the order, row 1, 2, 4, 5, 3.

The first two choices, Transparent and Untag all require no further action. Untag selected VIDs causes the

eight VLAN ID fields to become available:

	Ingress Mode	Egress Mode
LAN1	Tag VLAN ID: 1 VLAN Priority:	Untag selected VLAN IDs

Figure 18-7: Un-tagging selected VIDs

You may nominate up to eight VIDs for un-tagging; beyond simple range checking, there is no other validation.

Both Provider tagging and Provider tagging without filter enable the Provider parameters fields:

Provi	der param	eters are common to	all ports
Provider par	ameters		
VLAN ID:		VLAN Priorit	/: 0

Figure 18-8: Provider parameters

There is of course only one Provider VLAN ID. It is most likely yours, as the Provider!

Filtered VLAN IDs enables you to filter and block only frames tagged with one of the user defined VIDs. You can define up to eight VIDs per port. Other frames are not modified and are forwarded transparently.

When you are finished, remember to click **OK** (Figure 18-3) to save your entries.

Chapter 19

FCC/IC DFS Installation Procedure

FCC/IC 5.4/5.3 GHz Links: Background

The FCC/IC regulation for 5.4/5.3 GHz allows unlicensed wireless data equipment, provided that it does not interrupt radar services. If radar activity is detected, the equipment must automatically change frequency channel. This feature is termed Dynamic Frequency Selection (DFS). According to the standard, a channel with active radar is prohibited from use for 30 minutes. Before using a channel for transmission, the radio equipment must probe it for radar signals for a period of 60 seconds.

The FCC/IC regulations for 5.4 GHz band requires the frequency range 5600-5650 MHz to be banned from use. The FCC regulation for 5.4 GHz band requires that within 35 km radius from any (Terminal Doppler Weather Radars) TDWR location the frequency range 5570 – 5680 MHz shall be banned from use.

Follow the instructions in the last section of this chapter.

NetStream radio products support DFS as well as ACS.

An immediate consequence of the FCC/IC regulation for 5.4/5.3 GHz is that the standard method of link installation using a single default fixed installation channel, cannot be used.

Instead of the installation procedure of **Chapter 6**, a **link activation** method is used. The ODUs do not transmit until they are both configured and in place. An activation button may be found by navigating to **Site:Location | Air Interface.**

The ODUs are either supplied from the factory ready for use at 5.4 GHz or 5.3 GHz FCC/IC or alternatively, they can be set up for these bands using the Link Manager.

The following procedure is generic to all relevant NetStream radio products. What you see on your running Link Manager may differ in some details from the screen captures used to illustrate this chapter.

FCC/IC 5.4/5.3 GHz Link Activation

> To Activate a FCC/IC 5.4/5.3 GHz Link:

- 1. Install Link Manager software as usual.
- 2. Connect the PC to the IDU-ODU pair to be used as the local site.
- 3. Run the Link Manager and log in as Installer. You will see the following window:

Figure 19-6: FCC/IC 5.4/5.3 GHz operational

FCC 5.4 GHz Device Registration

The FCC requires that devices installed within 35 km of any TDWR location should be registered in the voluntary WISPA sponsored database.

The FCC has published a TDWR Location Information table that lists the exact location of all TDWR towers (see Table 19-1 at the end of the chapter).

- 1. When installing a 5.4 GHz device define your exact location (latitude and longitude)
- 2. Use the TDWR Location Information table to determine if the distance between the device and any TDWR tower is less than 35 km.
- 3. If the distance is less than 35 km then register the device in the voluntary WISPA sponsored database (following section)
- 4. Disable the frequencies between 5570 5680 MHz from the available channels list.
- 5. The frequency range between 5.600 to 5.650 GHz is not included in the available channels list.

Registering the Device

> To register a device:

1. Enter the website <u>http://www.spectrumbridge.com/udia/home.aspx</u> and follow the instructions.

At your first entry into the site, you will be required to register as a user:

2. Click the User Registration button to enter the registration page.

TDWR Table

The following table contains the latitude and longitude locations of Terminal Doppler Weather Radars (TDWR). Use this table to determine if the Master or Client device installed is within 35 km radius of a TDWR location. If one of the installed devices is within 35 km radius of any TDWR location then disable all frequencies between 5570 – 5680 MHz from the available channels list.

Table 19-1: Latitude and longitude locations of TDWRs (Continued)

Chapter 20

Quality of Service

Availability

The Quality of Service (QoS) feature is available for links using NetStream radios. If you already have this model, you can access the feature by carrying out a Software Upgrade to the 2.8.20 release.

To use the facility you must be familiar with the use of VLAN (802.1p) or Diffserv.

QoS - Overview

QoS is a technique for prioritization of network traffic packets during congestion.

NetStream links support two classification criteria, VLAN based or Diffserv based. You may choose which of them to use.

Quality queue	Prior	REDAT	
	Diffserv	VLAN	%
Real time	48-63	6-7	15
Near real time (responsive applications)	32-47	4-5	20
Controlled load	16-31	2-3	25
Best effort	0-15	0-1	40

Table 20-1: Default priorities and allocation by VLAN ID and Diffserv

For REDAT (Remaining Ethernet Data - Ethernet throughput) measurement. See **page 181**. REDAT measures remaining Ethernet throughput after reduction of bandwidth used by TDM channels. Use the Link Budget Calculator to see how much remaining bandwidth is available for Ethernet.

Based upon the classification criterion chosen, received packets will be mapped into one of four quality groups: Real time, Near real time, Controlled load and Best effort.

You may partition the total link capacity across the four Quality queues. The default weights as percentages are shown in Table 20-1.

Further, you may also limit the maximum information rate (MIR) for each queue per site.

Setting up QoS

You may set up QoS from either the Installation or Configuration wizards. Before doing so, set up for VLAN (Chapter 18) or Diffserv, depending on which you intend to use.

To define QoS settings for a link:

1. Using either the Installation or Configuration wizards, navigate to the Services window and choose the QoS tab.

Link (Link Configuration Wizard								
5	Services Select	the Services and R	ate from the li	sts belo	w.				
	Service	TDM Jitter Buffer	Hot Standby	Ring	Ethernet QoS	1			
	Config	gure Ethernet Quali	ty of Service		A	Configure			
					В	Configure			

Figure 20-1: Services window with QoS selected

Although QoS is a link-oriented feature, each site may have its own separate parameters.

2. Click the **Configure** button for a site.

Q	2oS Configuration - A							
	Mode	e: Disabled Disabled						
		802.1p DiffServ	[%]	Queue Priority Mapping	Maximum Information Rate [Kbps]			
	\checkmark	Real Time	0	-				
	\checkmark	Near Real Time	0	-				
	\checkmark	Controlled Load	0	-				
	\checkmark	Unlimited	0	-				
		·		·	OK Cancel			

Figure 20-2: Ethernet QoS Configuration - Mode selection

3. Choose the required mode - 802.1p (VLAN) or Diffserv.

l

QoS Configuration - A								
Mode: 802.1p -								
	Queue	Weight [%]	802.1p Priority Mapping	Maximum Information Rate [Kbps]				
V	Real Time	40 🌲	6 - 7	Unlimited				
	Near Real Time	25 🌲	4 - 5	Unlimited				
V	Controlled Load	20 🌲	2 - 3	Unlimited				
	Unlimited	15 🌲	0 - 1	Unlimited				
OK Cancel								
QoS C	onfiguration - A			? 🔀				
QoS (Configuration - A e: DiffServ	•		? 💌				
QoS C	Configuration - A e: DiffServ Queue	▼ Weight [%]	DiffServ Priority Mapping	Maximum Information Rate [Kbps]				
QoS (Mod	Configuration - A e: DiffServ Queue Real Time	▼ Weight [%]	DiffServ Priority Mapping 48 - 63	? × Maximum Information Rate [Kbps] Unlimited ▼				
QoS (Mod	Configuration - A e: DiffServ Queue Real Time Near Real Time	▼ Weight [%] 40 ↓ 25 ↓	DiffServ Priority Mapping 48 - 63 32 - 47	Maximum Information Rate [Kbps] Unlimited Unlimited				
QoS C Mod	Configuration - A e: DiffServ Queue Real Time Near Real Time Controlled Load	▼ Weight [%] 40 ↓ 25 ↓ 20 ↓	DiffServ Priority Mapping 48 - 63 32 - 47 16 - 31	Maximum Information Rate [Kbps] Unlimited • Unlimited • Unlimited •				
QoS Q Mod	Configuration - A e: DiffServ Queue Real Time Near Real Time Controlled Load Unlimited	▼ Weight [%] 40 ↓ 25 ↓ 20 ↓ 15 ↓	DiffServ Priority Mapping 48 - 63 32 - 47 16 - 31 0 - 15	Maximum Information Rate [Kbps] Unlimited Unlimited Unlimited Unlimited				

Figure 20-3: Top: VLAN allocation. Bottom: Diffserv allocation

- 4. The entry fields in both cases are self evident. Upon clicking OK,
 - If you over-book the Weight column, the last entered field will be reduced so that the total is 100%.
 - No weight field may be left zero. If you do, you will not be able to proceed until it is set to something:

Unlimited	0	÷ 🔒
-----------	---	-----

This reflects the implementation policy under which no checked queue may be completely starved. If you really do not want to use a queue under congestion, uncheck it.

• If you are under-booked, you will receive this notice:

• In any event, you may automatically apply the same settings to both link sites:

QoS Configuration - A
Apply this configuration to both sites?
Yes No Cancel

- 5. Priorities: You are completely responsible for the completeness and consistency of your VLAN or Diffserv priorities.
- 6. Choose a Maximum Information Rate for each queue:

Maximum Information Rate [Kbps]					
Unlimited 🛛 👻					
Unlimited					
1024000					
524288					
262144					
131072					
65536					
32768					
16384					
8192	DK Cancel				
4096					
Other					

Figure 20-4: MIR choice - per queue

If you previously used **Site | Ethernet | Maximum Information Rate (Chapter 9)** to globally limit the site, then your choice in Figure 20-4 will also be limited.

- 7. Click **OK** on the exit dialog to accept the settings. If you did not use these settings for the opposite site, you should configure it now.
- 8. Complete the wizard in the usual way.

Disabling QoS

In the dialog of **Figure 20-2**, choose the **Disabled** mode. The two sites may be enabled or disabled independently.

Capacity Upgrade

What is Capacity Upgrade

A NetStream 5x10 ODU may have its capacity increased by application of an upgrade license key. The Capacity Upgrade process consists of three steps:

- Data Gathering preparation of a list of NetStream 5x10 ODUs for upgrade by serial number
- Acquisition purchasing the Capacity Upgrade keys
- Application activating the Capacity Upgrade using the Link Manager

Applicability

You may only upgrade a NetStream 5x10 unit from 10 Mbps to 25 Mbps.

Data Gathering

For each relevant link, prepare a table similar to Table 21-1:

ODU Name (1)	ODU MAC Address (2)	ODU Serial Number (3)	Capacity Upgrade Key (4)
Site A	00xxyy41b205	PFC580E500000123	
Site B	00xxyy41b20e	PFC580E500000124	

Table 21-1: NetStream 5x10 ODU Capacity Upgrade Link List

Columns 1 is for your own convenience. Column 2 provides a precise connection between ODU identification and its serial number. Later you will copy/paste the Capacity Upgrade key into column 4 as a permanent convenient record.

To get the required link information:

- 1. Log on to the link.
- 2. Run the **Get Diagnostics** utility from the main button menu.

- 3. Load the generated Diagnostics Information.txt file into a plain text editor (like Notepad)
- 4. Search for the text string **Inventory**. You should see something like this:

```
Inventory
```

```
ODU

Product <Some product ID

String> HW Version 6

SW Version 2.8.00_b2970_Jan 17 2013

MAC Address <Your MAC address>

Serial Number PFC580E500000123
```

- 5. Copy the MAC Address to column 2 of the table (most likely for Site A).
- 6. Copy the string following the Serial Number to column 3 of the table.
- 7. Repeat the process to get the ODU serial number for Site B.
- 8. If you have several links, aggregate the Link Lists into one list (consider using a spreadsheet for the purpose).

Acquisition

Send the supplier of your equipment a Purchase Order for your Capacity Upgrade List (Use the aggregated version of Table 21-1). Ensure that you include a current email address for receipt of the key list. Upon completion of the order, you will receive an email with an attached list consisting of serial numbers and a licence key per serial number. The licence keys are quite long and it is important that you receive them in electronic format for subsequent copy/pasting.

Application

Carrying out the Capacity Upgrade

Each ODU must be upgraded individually. The process is very unforgiving of errors, so you should carefully carry out the following steps. It is assumed that you have Table 21-1 in a sortable format such as a spread sheet.

To prepare for application of the Capacity Upgrade keys:

- 1. Sort Table 21-1 by serial number.
- 2. Make a working copy of the Capacity Upgrade keys attachment file. Keep the original in a safe place.
- 3. Load the working copy into a spread sheet program and ensure that it is sorted by serial number.
- 4. Ensure that your table and the sorted list match line for line if not check carefully for errors of missed units.
- 5. Copy/paste the key column into column 4 of your own table.
- 6. For each link, log on as Installer. (For isolated "spare" ODUs, you may log on using Local

Connection.)

7. Open each Site in turn.

- 8. Open the **Inventory** page to check which line item in your table matches it.
- 9. Copy the Capacity Upgrade key to the clipboard
- 10. Open the the **Operations** page:

P Site Configuration - A	-		1000	×
File Actions Help		1	1	
Backup () Backup	e Refresh	& Buzzer Off	▼ [™] Installation Mode	
 System Air Interface Tx Power & Ant Hub Site Sync Management Inventory Security Date & Time Advanced Ethernet TDM Services External Alarms Operations 	Operations Factory Settings Restore to Factory Def Site Configuration diale IDU Detection Mode © Enabled License Key	fault Settings will b	bring down the connection. sed. Restore Defaults	t vate
		ОК	Cancel	Apply

- 11. Paste the key to the License Key field. The Activate button is enabled.
- 12. Click the **Activate** button. You will receive a confirmatory message if the activation succeeded or an error message if not. In the latter case, you will need to be in contact with your equipment supplier to solve the problem.

Completing the Capacity Upgrade

To make the upgrade effective, each upgraded ODU must be reset.

Persistency of the Capacity Upgrade

The upgrade is persistent across an ODU reset. If however, you restore a capacity upgraded ODU to factory defaults, you will need to apply the Capacity Upgrade to it again. This further underlines the importance of saving the license keys attachment file in a safe place and maintaining a record like Table 21-1.

Chapter 22

Changing The Factory Default Band

Why this is Needed

All ODUs supplied by Netronics come with preconfigured with a factory default productdependent band according to the ODU part number.

For ODUs supporting Multi-band, it may be changed using the procedure in this chapter. The procedure is generic, applying to all ODUs with the Multi-band feature.

- If for some reason the default band needs to be changed, it should be done before link installation.
- Use of an incorrect band may be in violation of local regulations.

Required Equipment

The minimal equipment required to change an ODU default band is:

- Laptop computer (managing computer) satisfying the requirements of Table 5-1.
- An installed copy of the Link Manager
- A PoE device
- An Ethernet LAN cable
- An IDU-ODU cable

The procedure

The following procedure is generic to all relevant Netronics radio products. What you see on your running Link Manager may differ in some details from the screen captures used to illustrate this chapter.

> To change the factory default band:

- 1. Using the IDU-ODU cable, connect the PoE device to the ODU, ensuring that the cable is plugged into the PoE port marked P-LAN-OUT.
- 2. Connect the Poe device to AC power.
- 3. Using a LAN cable, connect the LAN-IN port of the PoE device to the Ethernet port of the managing computer. The ODU will commence beeping at about once per second, indicating correct operation.
- 4. Launch the Link Manager.
- 5. Log on as Installer.

Internal 000004 28/02/2012 16:55:35 Connected to A Internal Connection Available 🕝 DFS Connection Mode: Network IP Address: 192.168.1.101 WBB-B

The change, which may take some time, is carried out. The result is reflected in the Link Manager main window:

Figure 22-6: Main Window after band change - new band circled

If you carry out this operation on a link, the band is effective on both sites and you are placed in installation mode.

Changing Band for DFS

Changing to a DFS band is similar to the foregoing procedure.

As soon as you establish a link using a DFS band, you are offered Configuration only in the main menu. Installation mode is disabled.

Special Products or Features: Entering a License Key

If you go to the Operations window as Installer (Figure 22-7), you will see a provision for entering a license key. Should you ever require such a key, the procedure is as follows:

To enter a License key:

- 1. Log on as Installer (as for the previous procedure).
- 2. Click the Site:Location tool bar button from the main tool bar.

Site Configuration - A		x

- 3. Enter your license key and click Activate.
- 4. When it is accepted, click **Cancel**.

License keys, where appropriate, are obtainable from Netronics Customer Support.

Provisions for Licensed 3.X and 2.5 GHz Bands

Overview

3.X Bands

The new NetStream 5x200 and NetStream 5x20 series add additional bands in the 3.X GHz range to those in Release 2.5.00. The new supported bands fall into two categories: The first category consists of those falling under the ubiquitous FCC, IC or ETSI regulation. The second category is referred to as Netronics Universal bands. These bands are known to be regulated but the numerous combinations of regulation and location preclude specific support.

Release 2.8.20 supports the band 3.3-3.8 GHz as follows:

• FCC part 90 subpart Z and IC RSS-197 supporting 3.650-3.700 GHz

- 3.650 3.675 GHz in Restricted mode
- Hardware ready for the Unrestricted Mode band operating in all 50 MHz of the 3.650 3.700 GHz band
- IC RSS-192 supporting 3.475 3.650 GHz
- ETSI 3.4 3.7 GHz split into three sub-bands, 3.650 3.675 GHz, 3.475 3.650 GHz and 3.590
 -3.710 GHz
- Netronics Universal 3.300-3.800 GHz.

Integrated and connectorized products are available. All of them are multiple band with the default band being 3.650-3.675 GHz other than the ETSI 3.4 - 3.7 GHz models.

The new products may be operated under 5, 10 and 20 MHz channel bandwidths and are broadly compatible with the full feature set of NetStream.

To meet regulatory requirements, a somewhat different procedure is required to set up links using these bands.

2.5 GHz Bands for BRS/EBS

The rationale for these bands and relevant details are described in **Chapter 24**. The installation method ids the same as for other licenced FCC bands as described below.

Terminology Recap

- Universal bands refer to Netronics Universal bands as described above
- **3.X or 3.X GHz** refers to the frequency range 3.300 3.800 GHz
- A **3.X ODU** is an ODU pre configured to operate in the 3.X GHz licensed bands
- A **3.X Link** in a NetStream link using a pair of 3.X ODUs
- **High Resolution Bands** Channel minimum step is 250 KHz. Applies to 3.475 3.650 GHz IC RSS-192, 3.4 - 3.7 GHz ETSI and the 3.3 - 3.8 GHz Universal band.
- Low Resolution Bands Channel minimum step is 1 MHz. Applies to FCC regulations in the 3.650 3.675 GHz band.
- **Inactive Mode** An ODU is powered up, in communication with a managing computer but not transmitting. It is required where regulation does not permit the use of Netronics' default Installation Mode frequency and channel bandwidth. The ODU may transmit using the licensed or registered band, channel bandwidth and permitted Tx power.
- Regular Mode The usual default Installation Mode

Regulatory Considerations for 3.650-3.675 GHz FCC/IC part 90 sub part Z

Restricted Mode

The band is supported in accordance with 3.650-3.675 FCC/IC part 90 subpart Z:

"Restricted contention protocols can prevent interference only with other devices incorporating the same or similar protocols. Equipment using a restricted protocol can operate only on the lower 25 megahertz (3650 - 3675 MHz)."

Transmission power options

Table 22-1 shows the extent of compliance by NetStream 5x200 products to FCC/IC power limits, having regards to antenna type and transmission power options.

		Measured					
		Freque	ency		Power		
Antenna	Nominal CBW	Low Center Frequency Channel [MHz]	High Center Frequency Channel [MHz]	Max Conducted Tx Power per Pole [dBm]	Total Conducted Max Tx Power [dBm]	Max EIRP [dBm]	
	5 MHz	3653	3672	11.14	14.14	35.14	
21dBi INT	10 MHz	3655	3670	14.46	17.46	38.46	
	20 MHz	3660	3665	17.36	20.36	41.36	
	5 MHz	3653	3672	11.14	14.14	35.14	
21dBi EXT (22dBi- 1dB feeder)	10 MHz	3655	3670	14.46	17.46	38.46	
	20 MHz	3660	3665	17.36	20.36	41.36	
	5 MHz	3653	3672	8.65	11.65	35.65	
24dBi EXT (25 - 1dB feeder loss)	10 MHz	3655	3670	11.36	14.36	38.36	
	20 MHz	3660	3665	13.73	16.73	40.73

Higher Transmission Power Options and Restrictions:

Table 22-2 defines the maximum transmission power and EIRP limits for the specified frequency and channel bandwidths.

It specifies the power limits to be used by the operator when assigning center frequencies.

Nominal CBW	Low Center Frequency Channel [MHz]	High Center Frequency Channel [MHz]	Max Conducted Tx Power per Pole [dBm]	Total Conducted Max Tx Power [dBm]	Max EIRP [dBm]
5 MHz	3653	3672	15.60	18.60	35.60
10 MH-	3655	3670	18.69	21.69	38.69
10 10112	3656	3669	22.00	25.00	38.50
20 MHz	3660	3665	21.18	24.18	41.18
	3661	3664	22.60	25.60	39.10

Table 22-2: Higher Transmission Power Limits

Availability Summary for FCC/IC and Universal 3.X GHz

Table 22-3: Availability for FCC/IC and Universal 3.X GHz

Products series	Occupied Band GHz	Regulation	Mode	Channel Bandwidth MHz	Max Tx Power dBm	Frequency Step KHz
	3.650-3.675	FCC/IC	Regular		25	1000
NetStream 5x200	3.475-3.650	IC	Inactive	5, 10, 20		250
	3.300-3.800	Universal	mactive		Unlimited	
	3.650-3.675	FCC/IC	Regular		25	1000
NetStream 5x20	3.475-3.650	IC	Inactive	5	23	250
	3.300-3.800	Universal				

Band Splitting for ETSI 3.4 - 3.7 GHz

The ETSI 3.4 - 3.7 GHz band is split into three sub-bands reflecting the different Max Tx Power allowed in each one. The details are shown in below:

Table 22-4: Band split for ETSI 3.4-3.7 GHz

Products series	Occupied Sub-Band GHz	Center Frequency GHz	Mode	Channel Bandwidth MHz	Max Tx Power dBm	Frequency Step KHz
	3.403-3.490	3.413- <mark>3.480</mark>			16	250
NetStream 5x200	3.470-3.610	3.480-3.600	Inactive	5, 10, 20	23(†)	
	3.590-3.710	3.600-3.700			25(‡)	
	3.403-3.490	3.413- <mark>3.480</mark>		5	16	250
NetStream 5x20	3.470-3.610	3.480-3.600	Inactive		23(†)	
	3.590-3.710	3.600-3.700			25(‡)	

(+) The 3.480 GHz frequency is overlapped, occurring in two different bands as shown. If you wish to use the 3.480 GHz frequency, you should set Max TX Power to 16 dBm.

(‡) The 3.600 GHz frequency is overlapped, occurring in two different bands as shown. If you wish to use the 3.600 GHz frequency, you should set Max TX Power to 23 dBm.

Using he Link Manager to set up a 3.X or BRS Link

Inactive and Active Mode

Low Resolution Band 3.X ODUs may be installed and configured in the usual way. What follows applies to High Resolution Band ODUs.

To ensure compliance with the relevant license, 3.X ODUs for IC, ETSI and Universal must be

configured from an inactive mode where the ODU is powered up, in communication with a managing computer but not transmitting.

Setting up a link is a two stage procedure:

- 1. Activate the ODUs by individually by configuring the band, frequency and channel bandwidth for the license
- 2. Complete link configuration in the usual way

To set up a 3.X or BRS ODU:

- 1. Log on to it as Installer (Operator sufficient for ETSI) and set the IP address as shown in Chapter 25.
- 2. Navigate to Site:Location | Air Interface and enter the Link ID for the ODU.
- 3. Click OK to dismiss the Site Configuration window. Answer Yes to the following popup message:

4. For ETSI models, skip to step 7 below. For all others, navigate to Tools Change Band. The following window is displayed:

😵 Change Band	? 🛛
Select a band from the list below	
Band Description	Installation Frequency (GHz)
3.655-3.670 GHz FCC/IC (default)	3.660
O 3.478-3.647 GHz IC	3.560
🔘 3.400-3.800 GHz Universal	3.660
The table contains data from the Location site only.	
Refresh	OK Cancel

5. Choose the required band. For illustration, we will choose the IC band.

2	🕅 Change Band 🔹 🥐							
	Select a band from the list below							
	Band Description	Installation Frequency (GHz)						
	3.655-3.670 GHz FCC/IC (default)	3.660

1 Operations						

9. Enter Installation Mode and confirm your choice:

Configu	ration 🛛 🛛
⚠	You are about to enter Installation Mode at 3560.00 MHz. Do you want to continue?
	Yes No

10. After a few moments of processing, you may click OK to dismiss the Site Configuration window. The ODU is now in normal Installation Mode:

- 11. Repeat the above procedure for the second ODU in the link, ensuring that the Link ID is entered correctly and the same band is chosen.
- 12. From this point, you may install both ODUs in the field according to the procedures in this User Manual.

Quick Install Mode

Why this is Needed

It may be required to temporarily suspend service traffic over a link without losing the link connection. The simplest way to do this is to place the link in Installation mode but without changing any configured parameters. Quick Install Mode is a "one click" method for doing this. The method is completely generic, working identically for all NetStream products.

Enabling Quick Install

By default, this feature is disabled.

> To enable Quick Install mode:

1. Log on to the Link Manager, navigate to **Tools | Preferences** and click the **Advanced** tab:

Preferences				X	
Monitor Events Adv	anced				
Alerts					
Restore Alerts					
Quick Install					
📝 Enable Quick In	stall				
SNMP parameters Monitor Interval:	1 👗	Sec.			
Tarrent	1	C			
inneout:	- -	Sec.			J
	ОК		Cancel	Apply	

Figure 23-1: Preferences: Quick Install

2. Check the **Enable Quick Instal** box and then OK. A new button is added to the main window toolbar:

File Configura	tion Tools	Maintenance Help		
ि Link Configuration	Link Installati	on Installation Mode	ی) Site: A	🤹 Site: B

Figure 23-2: New Install Mode button for Quick Install mode

Quick Install mode may be disabled by unchecking the Enable Quick Install box.

Using Quick Install

To suspend service traffic and enter Installation mode:

1. Click the Install mode button. You are offered a confirmatory message:

Quick Inst	tall 🛛 💌
1	You are about to enter Installation Mode.
	Don't show this again.

Figure 23-3: Change to Installation Mode cautionary message

2. Click **Yes** to continue. The link goes into Installation mode. The main window looks the same as if you had entered Installation mode in the usual way through one of the **Site** windows with the exception of the toolbar:

File	Configuration	n Tools Ma	intenance Help		
Link Co	infiguration L	ink Installation.	び Service Mode	Š Site: A	Site: B

Figure 23-4: Service Mode button to resume link service traffic

3. When you are ready to resume normal service traffic, click the **Service Mode** button. The following cautionary message is displayed:

Figure 23-5: Resumption of services cautionary message

4. Click **Yes** to continue. The link will resume normal services with your last set configuration parameters provides that you did not change link parameters in a way leading to sync-loss

It is also possible to change parameters in a way leading to service degradation. For example misconfiguring the number of antennas or transmission parameters at one side of the link may allow service to resume, but in a degraded fashion.

You may only enter Quick Install mode from a configured link. If you set both sites back to factory settings and chose Quick Install, you will not be able to continue.

Chapter 24

BRS/EBS Considerations

What is BRS/EBS?

The Broadband Radio Service (BRS), formerly known as the Multipoint Distribution Service (MDS)/Multichannel Multipoint Distribution Service (MMDS), is a US **FCC regulated** commercial service. **The relevant FCC rule is 47CFR part 27 subpart M**.

In the past, it was generally used for the transmission of data and video programming to sub-scribers using high-powered wireless cable systems. However, over the years, it has evolved to include digital two way systems capable of providing high-speed, high-capacity broadband service, including two-way Internet service via cellularized communication systems. Such services provide consumers integrated access to voice, high-speed data, video-on-demand, and interactive delivery services from a wireless device.

For further details see:

http://wireless.fcc.gov/services/index.htm?job=service_home&id=ebs_brs

This link (part of the FCC site) contains the Technical Rules covering matters such as:

- Operational scope
- Geographic service area
- Antenna registration

BRS/EBS Bands

The BRS/EBS band (post-transition) is illustrated in Figure 24-1 below and in more detail in the three tables following.

Observe that the BRS/EBS spectrum is divided into small channels, mainly of 5.5 and 6 MHz. There are two small ranges of 0.333 MHz channels as well.

BRS/EBS user may lease blocks of up to four contiguous channels to achieve their required channel bandwidth. These are often referred to as single, double, triple or quad bands.

Figure 24-1: BRS/EBS Bands Schematic

The tables below provide a detailed view of the spectrum from 2.495 GHz to 2.690 GHz The sections marked J and K are not detailed, since they are not supported by NetStream products.

Table 24-1: BRS/EBS Lower Band Segment (LBS)

Setting up a BRS/EBS link using NetStream 2.5 GHz Band

The key issue in setting up a NetStream 2.5 GHz Band BRS link is the choice of an appropriate channel bandwidth (CBW), which in turn depends on whether you are leasing a single, double, triple or quad band set.

NetStream BRS radios operate with channel bandwidths selectable from 5, 10 and 20 MHz. Choose your channel bandwidth in accordance with Table 24-3.

NetStream does not support the bands labelled J and K in Figure 24-1.

Part 4

Field Installation Topics

Chapter 25

Pre-loading an ODU with an IP Address

Why this is Needed

All ODUs supplied by Netronics come preconfigured with an IP address of 10.0.0.120. For use in a network, the ODUs must be configured with suitable static IP addresses. The method for doing this under office conditions is set out in **Chapter 6**.

There are two situations under which ODUs may need to be pre-loaded with an IP address prior to installation to a link:

- Changing an individual ODU in the field
- Preparing a large number of ODUs in a warehouse prior to deployment in the field, according to a network installation plan.

This chapter explains how do this.

Required Equipment

The minimal equipment required to pre-load an ODU with an IP address is:

- (1) Laptop computer (managing computer) satisfying the requirements of Table 5-1
- (2) An installed copy of the Link Manager
- (3) A PoE device
- (4) An Ethernet LAN cable
- (5) An IDU-ODU cable

If you have connectorized ODUs, two N-type RF terminators

Do **not** carry out this procedure using a multi homed managing computer also connected to a network. It will flood the network with broadcast packets. Further, it will throw any other links on the network into Installation mode.
The Procedure

The following procedure is generic to all NetStream radio products. What you see on your running Link Manager may differ in some details from the screen captures used to illustrate this chapter.

To Pre-load an ODU with an IP address:

- 1. Using the IDU-ODU cable, connect the PoE device to the ODU, ensuring that the cable is plugged into the PoE port marked P-LAN-OUT.
- 2. For connectorized ODUs, screw the RF terminators into the two antenna ports.

A powered up ODU emits RF radiation from the antenna port (or connected antenna). When working with a powered up connectorized ODU, always use RF terminators.

For an ODU with an integrated antenna, ensure that the antenna is always directed away from other people.

- 3. Connect the Poe device to AC power.
- 4. Using a LAN cable, connect the LAN-IN port of the PoE device to the Ethernet port of the managing computer. The ODU will commence beeping at about once per second, indicating correct operation.
- 5. Launch the Link Manager.
- 6. At the log on window, choose Local Connection.

IP Address:	Local Connection	
Password:		

Figure 25-1: Log on Window for Local Connection

7. Enter the default password, *admin*. After a few moments, the Link Manager main window appears:

Figure 25-7: Main Window after IP Address change

Some additional things you may want to do now:

- Go to Site **Installation | Air Interface**. You can enter a Link ID and change the Installation Frequency and Channel Bandwidth.
- If you log on as Installer, you can change the default band (Chapter 22).
- 13. Click **Cancel** to leave the open Management dialog. You may now exit the Link Manager, or connect to another ODU. If you choose to connect to another ODU, after about a minute, the main window of the Link Manager will revert to that shown in Figure 25-2 above. In any event, power down the changed ODU; your changes will take effect when you power it up again.

Don't forget to remove the RF terminators from a connectorized ODU after powering it down.

Tip: How to Recover a Forgotten ODU IP Address

If you have an ODU with lost or forgotten IP address, use the above procedure to log on to it using Local Connection. The IP address will appear in the left hand status area:

Figure 25-8: Existing IP address displayed after log-on with Local Connection

Link Budget Calculator

Overview

The Link Budget Calculator is a utility for calculating the expected performance of the NetStream wireless link and the possible configurations for a specific link range.

The utility allows you to calculate the expected RSS of the link, and find the type of services and their effective throughput as a function of the link range and deployment conditions.

User Input

You are required to enter or choose the following parameters. Depending on the product, some of the parameters have a default value that cannot be changed.

- Band, which determines frequency and regulation
- Channel Bandwidth
- Tx Power (maximum Tx power per modulation is validated)
- Antenna Type (cannot be changed for ODU with integrated antenna)
- Antenna Gain per site (cannot be changed for integrated antenna)
- Cable Loss per site (cannot be changed for integrated antenna)
- Required Fade Margin
- Rate (and Adaptive check box)
- Service Type
- Required Range

Link Budget Calculator Internal Data

For each product (or Regulation and Band) the calculator stores the following data required for link budget calculations:

- Maximum Transmit power (per modulation)
- Receiver Sensitivity (per modulation) for Ethernet service and for TDM services at various BER
- Maximum linear input power (used to calculate minimum distance)
- Antenna gain and cable loss for ODU with integrated antenna
- Available Channel Bandwidths

Calculations

EIRP

EIRP = TxPower + AntennaGain_{SiteA} – CableLoss_{SiteA}

Expected RSS and Fade Margin

ExpectedRSS = EIRP - PathLoss + AntennaGainSiteB - CableLossSiteB

where:

Site A is the transmitting site

Site B is the receiving site

PathLoss is calculated according to the free space model,

 $PathLoss = 32.45 + 20 \times \log_{10} frequency_{MHz} + 20 \times \log_{10} (RequiredRange_{Km})$

ExpectedFadeMargin = ExpectedRSS - Sensitivity

where Sensitivity is dependent on air-rate.

Min and Max Range

MinRange is the shortest range for which *ExpectedRSS* \leq *MaxInputPower* per air-rate.

MaxRange (with Adaptive checked) is the largest range for which

Expected $RSS \ge Sensitivity$, at the highest air-rate for which this relationship is true. In a link with adaptive rate this will be the actual behavior.

MaxRange (for a given air-rate) is the largest range for which Expected RSS \geq Sensitivity + RequiredFadeMargin.

Service

The Ethernet and configured TDM trunks throughput is calculated according to internal product algorithms.

Availability

The Service Availability calculation is based on the Vigants Barnett method which predicts the downtime probability based on a climate factor (C factor).

Availability

$$= 1 - 6 \quad 10^{-7} Cfactor \ frequency_{GHz} Required Range_{KM}^{3}$$

$$\frac{-Expected \ Fade \ Margin}{10}$$
10

Antenna Height

The recommended antenna height required for line of sight is calculated as the sum the Fresnel zone height and the boresight height. See **About the Fresnel Zone** below. Using the notation of **Figure 26-1**

below, splitting *ExpectedRange* into $d_1 + d_2$, the *Fresnel zone height* at distance d_1 from the left hand antenna, is given by

$$0.6 \times \sqrt{\frac{\frac{300}{frequency_{GHz}} \times d_1 \times d_2}{d_1 + d_2}}$$

For the most conservative setting, we take the mid-point between the antennas, setting

$$d_{1} = d_{2} = \frac{ExpectedRange}{2}$$
which gives
$$0.6 \times \sqrt{\frac{300}{frequency_{GHz}} \times \left[\frac{ExpectedRange}{2}\right]^{2}}$$

$$\frac{ExpectedRange}{2} + \frac{ExpectedRange}{2}$$
simplifying to
$$0.52 \times \sqrt{\frac{ExpectedRange}{frequency_{GHz}}}.$$
The boresight clearance height is calculated as:
$$= \sqrt{R^{2}_{Mean} + \left[\frac{ExpectedRange}{2}\right]^{2}} - R_{Mean}$$

where $R_{Mean} = 6367.4425 Km$.

About the Fresnel Zone

The Fresnel zone (pronounced "frA-nel", with a silent "s") is an elliptically shaped conical zone of electromagnetic energy that propagates from the transmitting antenna to the receiving antenna. It is always widest in the middle of the path between the two antennas.

Figure 26-1: Fresnel zone

Fresnel loss is the path loss occurring from multi-path reflections from reflective surfaces such as water, and intervening obstacles such as buildings or mountain peaks within the Fresnel zone.

Radio links should be designed to accommodate obstructions and atmospheric conditions, weather conditions, large bodies of water, and other reflectors and absorbers of electromagnetic energy.

The Fresnel zone provides us with a way to calculate the amount of clearance that a wireless wave needs from an obstacle to ensure that the obstacle does not attenuate the signal.

There are infinitely many Fresnel zones located coaxially around the center of the direct wave. The outer boundary of the first Fresnel zone is defined as the combined path length of all paths, which are half wavelength (1/2 λ) of the frequency transmitted longer than the direct path. If the total path distance is one wavelength (1 λ) longer than the direct path, then the outer boundary is said to be two Fresnel zones. Odd number Fresnel zones reinforce the direct wave path signal; even number Fresnel zones cancel the direct wave path signal.

The amount of the Fresnel zone clearance is determined by the wavelength of the signal, the path length, and the distance to the obstacle. For reliability, point-to-point links are designed to have at least 60% of the first Fresnel zone clear to avoid significant attenuation.

The concept of the Fresnel zone is shown in **Figure 26-1** above. The top of the obstruction does not extend far into the Fresnel zone, leaving 60% of the the Fresnel zone clear; therefore, signal is not significantly attenuated.

For more about Fresnel zone, see http://en.wikipedia.org/wiki/Fresnel_zone.

Running the Link Budget Calculator

The Link Budget Calculator is supplied on the Link Manager CD. It may be run stand-alone from the CD, from the Link Manager application or from the Windows Start Menu.

To run the Link Budget Calculator from the CD:

- Insert the Link Manager CD into the drive on the managing computer. In the window which opens, click the Link Budget Calculator option.
- If the CD auto run application does not start by itself, then point your browser to

Z:\WBB\Setup\DATA\Link Budget Calculator.htm where Z should

be replaced with your own CD drive name.

To run the Link Budget Calculator from the Windows Start Menu:

• Choose Start | Programs | Link Manager.

To run the Link Budget Calculator from the Link Manager:

• Choose Help | Link Budget Calculator from the main menu of the Link Manager as in the following figure:

Figure 26-2: Accessing the Link Budget Calculator

To run the Link Budget Calculator from the Windows Start Menu:

• Click Start | Programs | Link Manager | Link Budget Calculator. However invoked, your browser displays the following page:

Running the Link Budget Calculator

Figure 26-8: RFP Selection Guide

For collocation with:

- NetStream products, you may only use RFP B or E.
- NetStream 5x36 and 5x06 products, you may only use RFP E.
- 5. Enter the radio details. Note that Rate is chosen from a drop-down list:

Figure 26-9: Rate selector

If you choose Adaptive Rate, then the Rate list is unavailable as is the Climate factor list. Both of these quantities are calculated.

The **Rate** shown, defines the air interface rate in Mbps. The system operates in TDD mode and has the overhead of the air interface protocol. Thus, the Ethernet actual throughput is provided by the **Ethernet Rate**.

For a given air-rate, Ethernet throughput will decrease with increasing range due to propagation delay.

The Fade margin is the minimum required for line-of-sight (LOS) conditions. For degraded link conditions, a larger Fade margin should be used.

The EIRP is given in dBm and Watts.

6. If the required range between the two link sites is known, you may enter it directly. Alternatively, you may enter the latitude and longitude of each site in the link, in which case the distance between them will be calculated and displayed.

Running the Link Budget Calculator

9. At any time, click **Calculate** to recalculate the required performance estimate.

Placing the cursor in any other calculated field will also update the calculated results.

ſ	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	,Rate / / / / / Jefer,	promble and and ptillion
		Expected RSS / Fade Margin	-72 dBm
	Range	Min	0.1 Km / 0.1 Miles
		Max	69 Km / 42.9 Miles
		Required/Climate	37.1 Km 💌 Coordinates / Good (C=0.25) 🛛 ?
	Services	Туре	Ethernet Only 🛛 💌
		Ethernet Throughput	42.2 Mb/s (23.6 Mb/s Full Duplex)
	Installation	Antenna height for LOS	40 Meter / 131 Feet 13 Meter / 43 Feet (0.6 Fernel) 27 Meter / 89 Feet (Boresight clearance)
ι		anning and and	and the second s

Figure 26-14: LBC - Results section

The Expected Performance parameters are calculated and displayed:

- **Expected RSS** the expected RSS that the Link Manager shows when the NetStream ODUs are optimally aligned
- Services Type max number of T1 or E1 trunks if "Max Trunks" is selected

- Ethernet Rate maximum throughput available for the chosen parameter combination
- Antenna height for LOS the minimum antenna height required for line-of-sight operation. It is the sum of the height required for bore sight clearance due to the earth's curvature plus the height required to clear the Fresnel zone

If the expected performance is not suitable for your application, try different parameters and repeat the calculation.

To use the Link Budget Calculator page on Netronics website:

• Open a browser and browse to http://www.netornics-networks.com/support_lbc.html You will find instruction on how to use the Link budget calculator page on the same page as shown in the screen shot below

Chapter 27

Spectrum View

What is Spectrum View?

The Link Manager Spectrum View utility is an RF survey tool designed to support the link installation prior to full link service activation. The tool provides comprehensive and clear spectral measurement information enabling easier, faster and better quality installations.

You can view real-time spectrum information, save the spectral information and view retrieved spectral information from historic spectrum scans.

NetStream spectrum measurement and estimation algorithms are designed to show accurate information accommodating variations in frequency, temperature and interference power and at the same time overcoming anomalies that tend to occur in high interference environments.

Running Spectrum View in Installation Mode

To launch Spectrum View, go to the Link Manager main window menu and click **Tools |Spectrum View**.

Figure 27-1: Starting the analysis

To obtain a spectrum analysis:

- 1. Use the Timeout button to set the maximum time for the analysis. The default is 120 seconds.
- 2. Click **Start Analysis**. Since the anlysis will drop the link for its duration as set in 1, you are asked for confirmation:

3. Click **Yes**. After a few moments, the first results for the managing site appear:

Figure 23-2: Site A (managing site) done

The over-the-air site takes a little longer:

Figure 27-3: Site B (over- the-air site) done, showing current channel

The analysis complete when the Start Analysis button reverts to green. It never runs for longer than ten minutes and you may stop it any time by clicking the red **Stop Analysis** button.

If you are using a high resolution licensed band, the **Stop Analysis** button works differently: It will halt the analysis of the managed site (Site A), but it will not halt analysis of the over-the-air site (Site B).You should therefore ensure that the timeout value is not too high.

The results for the over-the-air site are displayed after the link is re-established regardless of whether the analysis completes by itself or was stopped.

Understanding the Spectrum View Display

Information Displayed

Figure 27-4 shows an annotated display taken from a live link.

Figure 27-4: NetStrem Spectrum View - annotated display

From Figure 27-4 above, you can see that the Spectrum View provides clear information including:

- Spectral measurement for each of the 4 receivers that make a NetStream link (two sites x two antennas per site)
- Spectral power measurements in 5 MHz channel granularity
- Current, average and maximum power per channel
- Indication of
 - o channels free from radars
 - o channels with radars detected
 - o barred channels (for DFS bands)
- Indication of scanned and un-scanned channels
- Indication of channels selected for ACS
- Notation of the current operational channel of the NetStream link

- Time stamp of the last spectrum scan
- Further, it supports zoom capability, selective view of antennas and sites constituting the link and selectable detail level

Changing the Display

Moving the mouse anywhere over one the display areas changes it to a cross hair. The mouse may then be used to select an area for zooming, or to enable a right-click System menu.

Selecting a rectangle and clicking will zoom the channels below it to full panel width:

Figure 27-5: Selecting an area of interest to zoom with the right mouse button down

Figure 27-6: Requested section zoomed

The zoom can be reversed using the System menu obtained by right-clicking any of the Spectrum View display panels. It also offers display variations such as maximum, average and current power per channel.

Figure 27-7: Spectrum View System menu

Here are two examples:

If you click **Show Max**, each panel will show the peak values recorded during the analysis:

Figure 27-8: Effect of setting Show Max

If you click **Show Average**, each panel will show the average values recorded during the analysis:

Figure 27-9: Effect of setting Show Average

Restricting the Panels to be Displayed

Click **View** for further viewing options:

📊 Spectrum View										
I	File	Viev	v Actions Help							
Sta	art Ar		Show Antenna		• ^{put}					
	-4		Show Max	Alt+M						
	4 4	~	Show Average	Alt+A						
	-6		Show DFS Info	Alt+D						
		~	Show Current Channel	Alt+E						
A	Potter		Restore Window Defaults	Ctrl+R						
		-								

Figure 27-10: Further viewing options

If for example you want Antenna A only, the resulting display will look like this:

Figure 27-11: Antenna A selected

Saving a Spectrum Analysis

Your analysis can be saved in a CSV (comma separated values) text file. Use the **Files | Save** menu item in the usual way.

Understanding the Spectrum View

The Spectrum View information is logged as part of the Diagnostics Information to improve link and system diagnostics and remote support. It can be retrieved from the Link Manager menu using **Help |Get Diagnostic Information**. The Spectrum View values in dBm, are noise-floor (NF) relative.

Here is an extract from a saved Spectrum View, imported to MS Excel:

Table 27-1: Spectrum View - Site A

Spectrum View	Spectrum View - Site: A										
Frequency	ls Scanned	Last Scan Timestamp	Last NF- AntennaA	Last NF- AntennaB	Average NF- AntennaA	Average NF- AntennaB	Max NF- AntennaA	Max NF- AntennaB

Management Integration

Spectrum view information is supported in WBB's MIB and can be used by external Network Management applications.

The Web Interface

What is it For?

The Web Interface (WI) enables you to carry out basic link management functions using a Web browser. It is an easy way to rapidly configure and setup a link.

It may be used to -

- Establish a link on a minimal basis for Ethernet only
- Check link parameters and make basic changes
- View the link Inventory
- Inspect the Recent Events logs

Who Needs it?

The WI is a tool for technicians to "quick install" a link with minimum effort. The technician may use the WI to install a link for Ethernet service.

It may also be employed by a user for a quick look at current operating parameters and the Recent Events logs. If the link was previously installed using the Link Manager, then the WI monitor window will also show TDM services.

How it Works?

Suppose that you have Site A (managing computer) on IP address 192.168.1.101 and Sit B (over-theair) on IP address 192.168.1.102, you would simply point your browser to either of these addresses and log on as shown below. As far as the WI is concerned, the site to which you log on becomes the **managed site** and the other site is "seen" as the **over-the-air site** regardless of the site to which you are physically connected.

What it Provides?

The WI provides an Installation/Configuration wizard as well as site configuration dialogs.

Prerequisites

Hardware

You need a regular LAN connection between a managing computer and one of the link ODUs. The WI is available for NetStream 100 and NetStream 5x50 ODUs at release level 2.6.00 or later.

Software

Your computer should have at least version 6 of MS Internet Explorer. The Web interface also works with other browsers such as Mozilla Firefox version 3 and later.

Technical Background

You should be familiar with the concepts underlying the Link Manager and preferably with the Manager itself.

Special Considerations Working with the WI

Advanced Configurations

For setup configurations using features such as HSS, TDM service, VLAN and QoS, you will need to use the Link Manager.

More on how WI Works

User Interface Considerations

Most standard Windows based Wizards have **Next**, **Back** and **Cancel** buttons on each Wizard window. Typically a Wizard does not commit your input until you complete it. You can always "back out" from the Wizard, abandoning your input by using the standard **Cancel** button. **The Web Interface Wizard works differently:**

192.168.1.101 ×	
Change Ba	ndwidth - Link: TPSF_BTT
Please select a bandwidth from th Available Bandwidth [MHz]	ne list below: Previous
10	Save & Next
20	
40	Refresh

Figure 28-1: Web interface - A typical Wizard window

Suppose that the Wizard window illustrated in Figure 28-1 is your current window. Then -

- It you use **Save & Next**, it first commits the data on the current window before moving to the next one.
- If you return to the previous window with the **Previous** button, it does not commit the current window
- If you exit the Wizard using the **Monitor** button, the current window is not committed, but prior commits are not undone.

Major implications of these differences will be pointed in **Caution** messages below.

Operational Effects

Several WI functions cause temporary sync loss. Typically, changing the number of antennas falls into this category. These cases will be pointed out in **Warning** messages.

Some Working Tips

You can:

- Log on to a ODU on the default IP address of 10.0.0.120/8, set the Link ID and IP address instead of using the Link Manager as in Chapter 25. Unlike the latter method, you need to reset the ODU to see the change in the Web Interface.
- Change the operating Band of an ODU instead of using the Link Manager as in Chapter 22. If you do, always change the band of the physical over-the-air site first, so that you do not lock yourself out of the link.
- Install/configure a link to work with Ethernet only.
- Look at Recent Events for either site
- Drop back to Installation mode without losing installed TDM services

You cannot:

- Change default Tx power
- Configure MIMO/Diversity
- Manage TDM services
- Manage HSS
- Manage other features such as GSU (when supported), MHS, Ethernet Ring, VLAN, QoS
- Perform Software upgrade

Be very careful:

Using this tool if your link is providing customer service which may not be interrupted with synclosses

Never:

Leave your browser unattended while in Installation mode - and then forget to return!

Scope of this Chapter

The remainder of this chapter is divided into three sections: Logging on, Link Configuration and Installation and Site Configuration.

Logging on

To use the Web interface, simply point your browser to the IP address of the site to which you are connected.

192.168.1.101 ×		
	Welcome	
User Name: Password:	admin •••••	
Log In		

Figure 28-2: Web interface - Log on

The User Name and Password are respectively, *admin* and *netman* as used for Telnet access. You must click the **Log In** button to effect entry to the WI.

The Main Window

Figure 28-3: Web interface - Main window

The main window shows a subset of the link operating parameters. The **A** and **B** buttons open Site Configuration for Site A and Site B respectively. The **Configure** button opens a Configuration Wizard.

For the purposes of illustration, we are using a link with 16 E1 ports configured. The reason for doing this will become apparent below.

Getting in to Installation Mode

Under certain circumstance you may be better off working in Installation mode, particularly if you want to change the Operating Band or Operating Channel. To this end, click the managed site button (A here), Air Interface and then Installation Mode. Figure 28-3 changes:

Figure 28-4: Web interface - Main window, Installation Mode

Using the Configuration Wizard

To configure a link using the Configure Wizard:

1. Start the Wizard by clicking the **Configure** button. The System page is displayed:

192.168.1.101	x	
	System - Link: TPSF_	BTT
Link ID:	EBG_20561334	
Link Name:	TPSF_BTT	Save &
Local Site Name:	Α	Next
Remote Site Name:	В	Refresh

Figure 28-5: Web interface - Configuration System window

The similarity to the corresponding Link Manager Configuration Wizard panel is quite intentional. The fields have the expected meanings. The Refresh button will revert your changes to the previous values provide you have not used the **Save & Next** button.

2. The second Wizard panel configures the Operating Channel settings:

Figure 28-6: Web interface - Configuration Channel settings

The only thing you may change here are the operating channels for ACS or none. If you make any changes, as soon as you click **Save & Next**, the link will immediately be reset to effect them. In Installation Mode, you may change the **Operating Channel**:
Installation Channel [GHz]:	5.820	~
Channel Bandwidth [MU=]:	5.735	<u>^</u>
Channel Bandwiddi [MH2].	5.740	ł
	5.745	
All	5.750	
	5.755	
	5.760	
5.735	5.765	
5 745	5.770	=
5.745	5.775	
5.755	5.780	
	5.785	
5.765	5.790	
	5.795	
5.775	5.800	
5 785	5.805	
0.700	5.810	
5.795	5.815	
	5.820	
5.805	5.825	×

Figure 28-7: Web interface - Installation Channel settings

You may select additional channels for ACS or none by using the **All** or **None** buttons or alternatively, manually selecting channels by clicking them. Suppose that you choose these:

All	None
5.735	5.740
5.745	5.750
5.755	5.760
5.765	5.770
5.775	5.780
5.785	5.790
5.795	5.800
5.805	5.810
5.815	5.820
5.825	5.830
5.835	5.840

You will receive the following advisory notice:

Please wait while system applies changes(this process may take a w You will be redirected to next page when operation completes.

Changing Operating Channels (for ACS) in either Configuration or Installation mode is applied immediately upon clicking **Save and Next**, and is accompanied by a short sync loss.

3. The next wizard panel displays antenna types and Tx power:

192.168.1.101 ×	
Antenna & TX	C Power - Link: TPSF_BTT
Site: A	
Antenna Connections:	External Previous
Antenna Type:	Dual
TX Power (per radio) [dBm]:	5 Save & Next
TX Power (system) [dBm]:	8
	Refresh
Site: B	
Antenna Connections:	External
Antenna Type:	Dual
TX Power (per radio) [dBm]:	5
TX Power (system) [dBm]:	8

Figure 28-8: Web interface - Antenna settings

The only fields that you can change here are the antenna types. (Required Tx power may become available for modification in a future release.)

4. Suppose that you change the Site A antenna type to single:

Site: A		
Antenna Connections:	External	Previous
Antenna Type:	Dual 🗸	
TV Dower (per redie) [dDm]	Undefined	Save &
TX Power (per radio) [dBin]:	Single	Next
TX Power (system) [dBm]:	Dual	
		Refresh

You are asked for confirmation. Click **OK**:

You are about to change ODU paramenters. This process may last several seconds. The system will enter into Installation Mode.
Do you want to continue?
OK Cancel

5. Accept the next browser initiated confirmation:

The WI displays the following advisory message:

Please wait while system applies changes... You will be redirected to next page when operation completes.

This operation leaves the link in Installation mode, where it remains until completion of the Wizard. The link then reverts to normal Active mode.

The next page - **Change Bandwidth**, is displayed:

192.168.1.101 ×	
Change Bar	ndwidth - Link: TPSF_BTT
Please select a bandwidth from the	e list below:
Available Bandwidth [MHz]	Previous
10	Save & Next
20	
40	Refresh

Figure 28-9: Web interface - Channel Bandwidth settings

6. For this example, leave the Bandwidth as is, and click **Save & Next**. Here is the result:

				Mon
		Monitor		
A	в	Configu	ire Log	jout
TPSF_BTT	Active	Site	Local	Remote
Link ID	EBG_205613 34	RSS [dBm]	-55	-53
Service	Ethernet + 10 X E1	EST Throughput [MB/s]	4.9	4.9
Channel BW [MHz]	20	RX [Mb/s]	0.0	0.0
Frequency [GHz]	5.820	TX [Mb/s]	0.0	0.0
Band	5.730-5.84 5 GHz ECC/IC	IP Address	192.168.1.101	192.168.1.102

The most obvious indication that something has changed is the reduced number of available E1 channels (from 16 to 10) reflecting the drop in link capacity due to the antenna change. Less obvious is the Estimated Ethernet Throughput, which has dropped from 17.5 Mbps to 4.9 Mbps on both sides of the link.

7. For the purpose of illustration we revert the link to dual antennas at both sites and run through the **Configure** Wizard again. Get to the last panel, Change Bandwidth:

01 ×	192.168.1.101 ×
Change Bandwidth - Link: TPSF_BTT	Change
e select a bandwidth from the list below:	Please select a bandwidth fr
ilable Bandwidth [MHz]	Available Bandwidth [
10 Save & Next	10
20	20
40 Refresh	40

8. Change the Channel Bandwidth to 40 MHz. (It is supported by the link regulation in use.) Click **Save & Next**. The following advisory message is displayed:

Please wait while system applies changes... You will be redirected to next page when operation completes.

Changing the Channel bandwidth drops the link into Installation mode, and it remains so after completing the Wizard.

After a few moments you are shown the main window:

192.168.1.101	× +				
		Monitor		Monit	or
А		3 Instal	Log	jout	
TPSF_BTT	Installati	Site	Local	Remote	
Link ID	EBG_205613 34	RSS [dBm]	-54	-54	
Services	None	EST Throughput [MB/s]	0.0	0.0	
Channel BW [MHz]	40	RX [Mb/s]	0.0	0.0	
Frequency [GHz]	5.820	TX [Mb/s]	0.0	0.0	
Band	5.730-5.84 5 GHz FCC/IC	IP Address	192.168.1.101	192.168.1.102	

You are in Installation mode! The link is up, but services are stopped. You must "walk" through the Install Wizard again, changing nothing. This will revert the link to Active mode with all services enabled. If you do not do

this, you will have to re-configure your services in the usual way, using the Link Manager.

Here then, is the final result:

192.168.1.101	×				
		Monitor		Mon	itor
А	в	Configu	ire Log	jout	
TPSF_BTT	Active	Site	Local	Remote	
Link ID	EBG_205613 34	RSS [dBm]	-54	-54	
Services	Ethernet + 16 X E1	EST Throughput [MB/s]	73.5	73.5	
Channel BW [MHz]	40	RX [Mb/s]	0.0	0.0	
Frequency [GHz]	5.820	TX [Mb/s]	0.0	0.0	
Band	5.730-5.84 5 GHz FCC/IC	IP Address	192.168.1.101	192.168.1.102	

Figure 28-10: Web interface - Configuration completed

Observe the dramatic increase in the Estimated Ethernet Throughput (from 17.5 Mbps to 73.5 Mbps on both sides of the link.)

Site Configuration

General

Site specific parameters may be managed by clicking the appropriate site button. There are some differences between what you may do with the managed site (A here) and the over-the-air site (B here). If you click the site A button, you are shown the System window. Common to all of the Site Configuration windows is the button menu:

Figure 28-11: Web Interface - Site Configuration button menu

The blue button indicates the currently active window. We will describe in detail each of the button menu items below.

On the right hand side of each Site Configuration window ia pair of action buttons:

Site Configuration

Figure 28-12: Web Interface - Site Configuration action buttons

Save commits the current window. If you made changes but prefer to revert them to their original values, use the **Refresh** button.

Refresh will revert to the last saved values or the original values if **Save** was not used. If you changed anything outside the WI with the Link Manager or any other network management tool, Refresh with update the WI.

System

192.168.1.101	×	nfiguration - A	1	Monitor
System	Air Interface	Inventory	Management	Other
Name:	A			
Contact:	Joe			Save
Location:	Α			
Up Time:	000:03:02:36	[ddd:hh:m	ım:ss]	Refresh
Reset	Recent Events			

Figure 28-13: Web Interface - Site Configuration System window

In this window, the **Name**, **Contact** and **Location** fields may be changed. Location is the site name (A). if you click **Recent Events**, the site A ODU Recent Events list is displayed:

192.	168.1.101	×		
		R	ecent Events - A	Monitor
			Refresh	
#	Severity	Date & Time	Description	Interface
1	Event	09/01/2005 00:00:00	ODU is ready

3	Normal	09/01/2005 00:00:00	Management port status changed to connected - 100Mbps/Full Duplex	Management Port on Odu
4	Major	09/01/2005 00:00:00	Management port status changed to disconnected	Management Port on Odu
5	Major	09/01/2005 00:00:00	TDM Service - Alarm. The reason is: Service is closed	
6	Event	09/01/2005 00:00:00	The time was set to: THU SEP 01 00:00:00	

Figure 28-14: Web Interface - Site Configuration Recent Events list

From here, you are returned to the WI main window (Monitor button).

If you open the Site Configuration window for site B (over-the-air), the **Recent Events** button is missing. To sse the Recent Events list for site B, you must log on to site B. You may do it by simply opening up another browser window or tab, concurrently with the site A tab.

Air Interface

192.168.1.101 ×		
Cor	nfiguration - A	Monitor
System Air Interface	Inventory Management	Other
Link ID:	EBG_20561334	
Installation Frequency [GHz]:	5.820	Save
Channel Bandwidth [MHz]:	40	
Buzzer:	Off 🗸	Refresh
Installation Mode Band	Antenna & TX Power	

Figure 28-15: Web Interface - Site Configuration Air Interface

The only editable field is the Buzzer state. The three buttons at the bottom are fully functional and should be used with care:

Installation Mode

This button places the link in Installation mode: Services are stopped.

Change Band

Change Band should be used with care. It is not available on the Air Interface window of the overthe-air site (B). Again, you must create a separate session to use it on B.

To change Band for a Link:

1. Log On to the over-the-air site (B).

Available Band						
Band Description	Install Frequency					
2.412-2.462 GHz FCC/IC	2.437					
5.000-5.150 GHz Universal	5.040					
5.150-5.335 GHz Universal	5.280					
5.260-5.340 GHz FCC/IC	5.280					
5.485-5.710 GHz FCC	5.580					
5.485-5.710 GHz IC	5.580					
5.475-5.720 GHz Universal	5.580					
5.730-5.845 GHz FCC/IC	5.820					
5.740-5.835 GHz MII	5.780					
5.740-5.950 GHz Universal	5.780					
5.835-5.865 GHz WPC	5.840					

- 2. Chose the required band and save. You will lose contact with site B.
- 3. Repeat the process for site A. The link will re-sync using the newly chosen band in Installation mode.
- 4. Re-install the link.

Antenna & Tx Power

The Antenna and Tx Power window is for information only.

🗋 192.168.1.101 ×		
A	ntenna & TX Power - A	Monitor

	ODU	100Mbps/Full Duplex	~		
	LAN1	100Mbps/Full Duplex	AUTO 🗸		Refresh
	LAN2	100Mbps/Full Duplex	AUTO 🔽		

Figure 28-19: Web Interface - Site Configuration, Ethernet ports configuration

You may change the mode for LAN 1 and LAN 2 only:

Ethernet Ports Configuration							
Port	Current	Mode					
ODU	100Mbps/Full Duplex	~					
LAN1	100Mbps/Full Duplex	AUTO 🔽					
LAN2	100Mbps/Full Duplex	AUTO 10Mbps/Half Duplex					
		10Mbps/Full Duplex 100Mbps/Half Duplex 100Mbps/Full Duplex DISABLE					

Figure 28-20: Web Interface - Site Configuration, Ethernet ports configuration, detail Here is the corresponding situation for a link using GbE support:

Ethernet Ports Configuration								
Port	Current	Mode						
ODU	1000Mbps/Full Duplex	AUTO 🔽						
LAN1	1000Mbps/Full Duplex	AUTO 🔽						
LAN2	100Mbps/Full Duplex	AUTO 💌						

Figure 28-21: Web Interface - Site Configuration, Ethernet ports configuration with GbE

Notice that under GbE support, the ODU port mode is also configurable. Here is the Monitor panel for the GbE link:

TPSF_B	п	Active	Site	Local	Remote
Link ID)	EBG_205613 34	RSS [dBm]	-54	-54
Service	s	Ethernet	EST Throughput [MB/s]	198.4	198.4
Channel E [MHz]	зw	40	RX [Mb/s]	0.0	0.0
Frequen [GHz]	су	5.820	TX [Mb/s]	0.0	0.0
Band		5.730-5.84 5 GHz FCC/IC	IP Address	192.168.1.101	192.168.1.102

Figure 28-22: Monitor panel for NetStream 5x200 link, using Ethernet only and GbE support

Note the 200 Mbps aggregate throughput in both directions.

Part 5

Product Reference

Appendix A

Technical Specifications

Scope of these Specifications

This appendix contains technical specifications for the major link components appearing in this User Manual. They are correct at the date of publication, but are intended for general background only. The latest authoritative and most up to date technical specifications are available as Data Sheets obtainable from Netronics Customer Service.

In any event, Netronics reserves the right to change these specifications without notice.

ODU

	Series		Thro (1	Max Throughput (Mbps)		es	Notes	
	NetStream 100 200		200		16 E1/T1			
Capacity (Net Aggregate FD)	NetStream	n 10	20		3 E1 or 4 T	1		
	NetStream	n 50	50		16 E1/T1

6.4 L	Universal	5.890-6.410	20		

The following Max Tx Power limitations apply to all products supporting the 3.5 GHz ETSI band:

Occupied Sub-Band GHz	Center Frequency GHz	Mode	Channel Bandwidth MHz	Max Tx Power dBm	Frequency Step KHz
3.403-3.490	3.413- <mark>3.480</mark>			17	
3.470-3.610	3.480-3.600	Inactive	5, 10, 20	23(†)	250
3.590-3.710	3.600-3.700			25(‡)	

(†) The 3.480 GHz frequency is overlapped, occurring in two different bands as shown. If you wish to use the 3.480 GHz frequency, you should set Max TX Power to 17 dBm.

ODU

(‡) The 3.600 GHz frequency is overlapped, occurring in two different bands as shown. If you wish to use the 3.600 GHz frequency, you should set Max TX Power to 23 dBm.

Appendix A

IDU-NetStream DT

Management

Management Application (per link)	ink Manager Web based manager for NetStream 5x50 and NetStream 5x200 series.		
Protocol	SNMP and Telnet		
NMS	WBB NMS		

Environmental

Operating Temperatures	ODU: -35°C to +60°C / -31°F to +140°F
Humidity	100% condensing, IP67 (totally protected against dust and against immersion up to 1m)
Storage	-40° to 85°C / -40°F to 185°F

Mechanical

ODU with Integrated Antenna	37.1/14.84(W) x 37.1/14.84(H) x 9.00/3.6(D) cm/in; 4.2 kg / 9.2 lbs including Mounting Kit
ODU Connectorized (including SFF antenna ODUs in NetStream 5x50 series)	18.0/7.2(W) x 27.0/10.8(H) x 5.5/2.2(D) cm/in; 3 kg / 6.6 lbs including Mounting Kit

Power

Power Feeding	Dual feeding, -20 to -60 VDC (AC/DC converter is available)
Power Consumption - alone	25W
Power Consumption with IDU	See IDU specifications, this Appendix

Safety

FCC/IC (cTUVus)	UL 60950-1, UL 60950-22, CAN/CSA C22.2 60950-1, CAN/CSA C22.2 60950-22		
ETSI/IEC	N/IEC 60950-1, EN/IEC 60950-22		
EMC			
FCC	47 CFR Class B, Part 15, Subpart B		
ETSI	EN 300 386, EN 301 489-1, EN 301 489-4		
CAN/CSA	CISPR 22Class B		
AS/NZS	CISPR 22Class B		

IDU-NetStream DT

TDM Interface

Number of ports	2 or no TDM port
Max ports usable by NetStream	2
Туре	E1/T1 configurable by Link Manager
Framing	Unframed (transparent)
Timing	Independent timing per port, Tx and Rx
Standards Compliance	ITU-T G.703, G.826
Line Code	E1: HDB3 @ 2.048 Mbps, T1: B8ZS/AMI @ 1.544 Mbps
Latency	Configurable 5-20 ms

IDU-NetStream DT

Impedance	E1: 120 Ω , balanced, T1: 100 Ω , balanced
Jitter & Wander	According to ITU-T G.823, G.824
Jitter Buffer	litter Buffer configuration enabling a latency from 5ms to 16ms for interference immunity confront
Clock Recovery Resolution	0.05ppb
Clock stability	20ppm as clock master (crucial for wander requirements of cellular operators)

Ethernet Interface

Number of Ports	2
Туре	10/100BaseT with Auto-Negotiation (IEEE 802.3u). Framing/Coding IEEE 802.3
Connector	RJ-45
Line Impedance	100Ω
VLAN Support	Transparent
Maximum Frame Size	2048 Bytes
Bridge	Layer 2, self-learning of up to 2047 MAC addresses (IEEE 802.1Q), hub/Bridge selectable mode
Latency	3 ms (typical at 20 MHz Channel Bandwidth

Dry Contact Alarms

Dry Contact Alarms	4 Inputs + 4 Outputs; Configurable by the Link Manager
--------------------	--

ODU Interface

Connector	RJ-45
Cable	Outdoor CAT-5e cable; Maximum cable length: 100 m

Mechanical

Style	Half 19" wall mounted or desktop
Dimensions	22cm(W) x 17cm(D) x 4.4cm(H)
Weight	0.5 kg/1.1 lbs

Power

Power Consumption	
With NetStream ODU	< 35W
Alone	< 5W
Power Feeding Options	110 – 240 VAC*; -20 to -60 VDC

Environmental

Operating Temperatures	0°C - 50°C / 32°F - 122°F
Humidity	90% non-condensing
Storage	−20° to 70°C / -−4°F to 158°F Humidity 95%

IDU-NetStream RM

Safety

τυν	UL 60950-1, CAN/CSA C22.2 60950-1
EN/IEC	60950-1

EMC

FCC	47 CFR Class B, Part 15, Subpart B
ETSI	EN 300 386, EN 301 489-4
CAN/CSA-CEI/IEC	CISPR 22 Class B
AS/NZS	CISPR 22:2006 Class B

IDU-NetStream RM

TDM Interface

Number of ports	16, 8, 4 ports or no TDM ports.
Max ports usable by NetStream	16 (model dependent)
Туре	E1/T1 configurable by Link Manager
Framing	Unframed (transparent)
Timing	Independent timing per port, Tx and Rx
Connector	RJ-45
Standards Compliance	ITU-T G.703, G.826
Line Code	E1: HDB3 @ 2.048 Mbps, T1: B8ZS/AMI @ 1.544 Mbps
Latency	Configurable 5-20 ms (default 8 ms)
Impedance	E1: 120Ω, balanced, T1: 100Ω, balanced
Jitter & Wander	According to ITU-T G.823, G.824
Jitter Buffer	litter Buffer configuration enabling a latency from 5ms to 16ms for interference immunity confront
Clock Recovery Resolution	0.05ppb
Clock stability	20ppm as clock master (crucial for wander requirements of cellular operators)
Monitored Hot Standby	Supported

Ethernet ports

Number of Ports	2
Туре	10/100/1000BaseT with Auto-Negotiation (IEEE 802.3u). Framing/Coding IEEE 802.3
Connector	RJ-45
Line Impedance	100Ω
SFP Interface	1 port, Type: Fast Ethernet
VLAN Support	Transparent
Maximum Frame Size	2048 Bytes
Bridge	Layer 2, self-learning of up to 2047 MAC addresses (IEEE 802.1Q), hub/Bridge selectable mode

IDU-NetStream RM

Appendix	Α
----------	---

Latency	3 ms
---------	------

Dry Contact Alarms

Dry Contact Alarms	4 Inputs + 4 Outputs; Configurable by the Link Manager

ODU Interface

Connector	RJ-45
Cable	Outdoor CAT-5e cable; Maximum cable length: 100 m

Mechanical

Style	1U 19" Rack mounted
Dimensions	43.6 cm (W) x 21 cm (D) x 4.4 cm (H)
Weight	1.5 kg/3.3 lbs

Power

Power Consumption	
With NetStream ODU	< 35 W
Alone	<10 W
Power Feeding Options	Dual feeding, -20 to -60 VDC, AC Power Adapters available

Environmental

Operating Temperatures	0°C - 50°C / 32°F - 122°F
Humidity	90% non-condensing
Storage	-20° to 70°C /4°F to 158°F Humidity 95%

Safety

τυν	UL 60950-1, CAN/CSA C22.2 60950-1
EN/IEC	60950-1

EMC

FCC	CFR47 Class B, Part 15, Subpart B
ETSI	EN 300 386, EN 301 489-4, EN 301 489-1
CAN/CSA-CEI/IEC	CISPR 22 Class B
AS/NZS	CISPR 22:2006 Class B

IDU-DT6 (Aggregation Unit)

Ethernet Interface

PoE Interfaces	6 x legacy mode PoE ports(10/100/1000 Mbps), up to 25 W per port
Ethernet Ports	2 x RJ-45 PHY ports of 10/100/1000 Mbps Based-T Ethernet
LAN Interface Framing/Coding	IEEE 802.3/U

IDU-DT6

LAN Interface Line Impedance	100Ω
LAN Interface Ethernet Mode	Auto-negotiation 10/100/1000
SFP Interfaces	2 x SFP ports of 1000 Mbps (standard MSA)
MAC Address Entries	Up to 1K MAC Address entries
Maximal Frame Size	2048 bytes
Ethernet Latency	3 ms

Mechanical

Dimensions	1U 19" Rack mounted, half width
Weight	0.8 Kg

Power

Internal Power Consumption	< 15 W @ Maximal Power feeding
Power Feeding	44 VDC – 56 VDC, Dual redundant inputs. 3 pin female DC connector
Grounding	Front panel grounding lug
Protection	 DC input Line & Reverse Polarity protection PoE Ports over/under Current & over/under Voltage protections

Environmental

Operating Temperatures	-40°C to 55°C / -40°F to 131°F
Humidity	90% non-condensing
Storage	-40° to 70°C / -40°F to 158°F Humidity 95%

Safety

τυν	UL60950-1, CAN/CSA-C22.2 No. 60950-1
ETSI/IEC	EN/IEC 60950-1

EMC

FCC	47CFR Part 15, Subpart B, Class B
ETSI	EN 300 386; 301 489-4; 301 489-1
CAN/CSA- AS/NZS	CISPR 22 Class B

GbE PoE Device - Indoor, AC

Electrical

AC Input Voltage	100 - 240 VAC nominal, 90 - 264 VAC max range
Input Frequency	47 - 63 Hz
Input Current	2.0 A (rms) 115 VAC at Max. load 1.2 A (rms) 230 VAC at Max. load
Max. In-rush Current	30 A for 115 VAC at Max. load 60 A for 230 VAC at Max. load
Standby Power	0.5 W (Max) at 240 Vac

GbE PoE Device – Indoor, AC

DC Output Voltage	56 VDC
Protection	 Short circuit protection Auto recovery Over voltage protection
Indication	Green led for normal operation

Interfaces

PoE output	RJ-45 connector
PoE to ODU Interface	Outdoor CAT 5e; Maximum cable length: 75 m for 1000BaseT or 100 m for 10/ 100BaseT.
Ethernet input	RJ-45 connector
AC input on device	Standard socket IEC320 C14 type
AC cable	Variety of AC plugs available (see below)
Ethernet / ODU	WBB RJ-45 connector
Ethernet LAN interface type	RJ-45, 10/100/1000BaseT Interface (Line Impedance -100)

Mechanical

Case	Plastic
Dimensions	16 cm (W) x 6.3 cm (D) x 3.33 cm (H)
Weight	250 g

Environmental

Operating Temperatures	0°C to 40°C/32°F to 104°F
Humidity	90% non-condensing

Safety

ULCSA	60950-1, C22.2 No. 60950-1
ETSI/IEC	IEC/EN 60950-1

EMC

ESD	61000-4-2
RS	61000-4-3
EFT	61000-4-4
Surge	61000-4-5
cs	61000-4-6
DIPS	61000-4-11
EMI	FCC part 15 class B, CISPR Pub 22 class B, AS/NZS CISPR 22 class B

PoE Device - Outdoor, DC

Electrical

Input voltage range	-20 to -60 VDC (single input)
Output voltage	48 VDC / 0.6 A
Power Consumption	0.5W (not including radio)
Protections	Differential – 15 KW Common – 3 KW

Interfaces

Ethernet LAN interface type	RJ-45, 10/100BaseT Interface (Line Impedance -100)
DC input	2 pins connector
ODU (PoE Port)	RJ-45

Mechanical

Enclosure	All weather cases
Dimensions	24.5 cm (H) x 13.5 cm (W) x 4.0 cm (D)
Weight	1.0 kg/2.2 lbs

Environmental

Operating Temperatures	-35° C to 60° C / -31° F to 140° F
Humidity	Up to 100% non-condensing
Standards	IEC 60721-3-4 Class 4M5 IP67

Safety

FCC/IEC/ CAN/CSA	Designed to meet 60950-1, 60950-22

EMC

ETSI	Designed to meet EN 300 386; EN 301 489-1
FCC	Designed to meet 47CFR Part 15, Subpart B, Class B
CAN/CSA	Designed to meet ICES-003 Class B
AS/NZS	Designed to meet CISPR 22 class B

GSU

Configuration

Architecture	Outdoor Synchronization Unit; Including External GPS Antenna, HSS cable and PoE device
GSU to PoE Interface	Outdoor CAT 5e cable; Maximum cable length: 100 m

Lightning Protector

Mechanical

Dimensions	24.5 cm (H) x 13.5 cm (W) x 4.0 cm (D)
Weight	1.0 kg/2.2 lbs

Power

Power Feeding	Power provided by PoE device
Max Power Dissipation	10 Watt

Environmental

Operating Temperature Range	-35°C to 60°C / -13°F to 140°F
Humidity	Up to 100% non-condensing

Safety

	EN/IEC	Designed to meet EN/IEC 60950-1, 60950-22
--	--------	---

EMC

FCC	Designed to meet 47CFR Class B, Part 15, Subpart B
ETSI	Designed to meet EN 300 386; EN 301 489-4; EN 301 489-1
CAN/CSA-CEI/IEC	Designed to meet CISPR 22-02
AS/NZS	Designed to meet CISPR22 Class B

Lightning Protector

Electrical

Compatible Interfaces	10/100/1000BaseT
Data Rates	Up to 1000 Mbps
Nominal Operational Voltage	48 VDC
Maximum Operational Voltage	60 VDC - 650 mA
Maximum Continuous current	1 A
Impedance	90 to 110 Ohm
Connection type	RJ45 CAT 5e STP (shielded)
Pin-out	8 wires + shielding
Pins Protected	All pins protected
Response time	<5 microseconds (with ODU)

Nominal discharge currents

Line to Line	500 A @ 8/20μs
Line to Ground	2000 A @ 8/20μs

Antenna Characteristics

An antenna is the radiating and receiving element from which the radio signal, in the form of RF power, is radiated to its surroundings and vice versa. The transmission range is a function of the antenna gain and transmitting power. These factors are limited by country regulations.

The NetStream may be operated with an integrated antenna attached to the ODU unit, or with an external antenna wired to the ODU via a N-type connectors. All cables and connections must be connected correctly to reduce losses. The required antenna impedance is 50 Ω .

Appendix B

Wiring Specifications

ODU-IDU Cable

The ODU-IDU cable is shielded/outdoor class CAT 5e, 4 twisted-pair 24 AWG terminated with RJ-45 connectors on both ends. A cable gland on the ODU side provides hermetic sealing.

The following table shows the connector pin out:

Function	Color	IDU	ODU
Ethernet (RxN)	White/Green	1	1
Ethernet (RxT)	Green	2	2
Ethernet (TxT)	White/Orange	3	3
Ethernet (TxN)	Orange	6	6
Power (+)	Blue	4	4
Power (+)	White/Blue	5	5
Power ()	White/Brown	7	7
Power ()	Brown	8	8

IDU (all models) Alarm Connector

The IDU Alarm interface is a 25 pin D type female connector. Its pin out is listed in Table B-6.

Table B-6:	IDU Alarm	Connector	(Drv	Contact)
			\-··	

I/O	Description	Pin
Input 1	Positive	14
Input 1	Negative	15
Input 2	Positive	16
Input 2	Negative	17
Input 3	Positive	18
Input 3	Negative	19
Input 4	Positive	20
Input 4	Negative	21
Output 1	Normally Open	1
Output 1	Common	2
Output 1	Normally Closed	3
Output 2	Normally Open	4
Output 2	Common	5
Output 2	Normally Closed	6
Output 3	Normally Open	7
Output 3	Common	8
Output 3	Normally Closed	9
Output 4	Normally Open	10
Output 4	Common	11
Output 4	Normally Closed	12

The figure below, shows how to connect external input and output alarms.

- Use an external current limit resistor to limit the current at the output relays to 1 Amp. Such resistor is not required if the equipment connected to the IDU supports current limiting to 1 Amp.
- The voltage of the input alarm must be within the range of -10 to -50 VDC.

Unbalanced Mode for E1 Interface

You may configure the E1 interface to unbalanced mode (75 ohm) using the Link Manager.

Figure B-2 shows an adapter cable for connecting devices with balanced E1 interface to the user equipment with unbalanced E1 interface. The Y splitter cable includes one RJ-45 balanced connector (left) and two unbalances BNC coaxial connectors (right).

Figure B-2: Unbalanced E1 adapter cable (Y Splitter)

Figure B-3 provides a schematic:

Figure B-3: Unbalanced E1 adapter cable (Y Splitter) - schematic

BNC Connector	Color Code	RJ-45 Connector Pin
2 (NGND)	Pod	1, 4, 7, 8
1 (Center)	neu	2
2 (NGND)	Green	1, 4, 7, 8
1 (Center)	Green	5

Table B-9: E1 Y Splitter Pin out for Unbalanced Mode

The Y-splitter cable cannot be used as a balanced to unbalanced converter. The cable merely provides a physical interface conversion without any impedance matching. Some devices automatically detect cable insertion and change the impedance internally
Appendix C

Small Form-factor Pluggable Transceiver

IDU-NetStream RM SFP Support

The Small Form-factor Pluggable (SFP) transceiver, is a compact, hot pluggable transceiver used in communications applications.

The SFP transceiver technology allows almost any protocol converter implementation with seamless integration to a standard Ethernet switch.

The IDU-NetStream RM supports SFP transceivers to provide and support several network applications.

Any standard Fast Ethernet (FE) SFP transceiver can be plugged into the IDU-NetStream RM. These SFPs support various Ethernet interfaces. For example a fibre optic interface can be used to support long fibre distances.

In addition, System on SFP transceivers can be used, supporting a *protocol converter* concept. The main application for such SFP transceivers is *TDM over Ethernet* providing E1/T1 or E3/T3 over full duplex Ethernet Remote Bridge

The following table provides a few SFP types that can be used with the IDU-NetStream RM:

Table C-1: SFP Type and Interface description

SFP Туре	Interface Description	
100 baseT/1000 baseT	100BaseT,1000BaseT IEEE 802.3, UTP CAT 5	
100baseFX/1000baseFX	Multimode fiber-optic (MMF) link spans up to 2km long	
100baseLX/1000baseLX	Single-mode fiber optic (SMF) links pans up to 10km	
100baseBX/1000baseBX	SMF single-strand link spans up to 10 km or 40 km	
E1/T1/FE	E1/T1 with 100 M	
E3/T3/FE	E3/T3 with 100 M	
E1/T1/GBE	E1/T1 with 1000 M	
E3/T3/GBE	E3/T3 with 1000 M	

Appendix D

External Alarms

External Alarms Specification

The IDU-NetStream RM and new style IDU-NetStream DT support external input and output alarms through a standard DB25 pin female connector (see page B-375 for pin out details).

Input alarms

The input alarms are raised by events from external equipment, such as a fire warning, door open or air conditioner failure. They are user defined.

Output alarms

Output alarms are generated through dry contact relays to indicate various system events such as sync loss or disconnection. An alarm is raised if at least one of the conditions in one of the tables below, is met.

IDU-NetStream RM and new style IDU-NetStream DT Alarms

Alarm	Description	Alarm On Conditions	Alarm Off Condition
Output 1	Air interface Alarm	 Link is down Link in installation mode Link authentication problem 	Link is up or equipment alarm is ON
Output 2	Equipment Alarm	Built in Test (BIT) errorNo connection to the ODU	Both ODU and IDU are in operational state
Output 3	Service Alarm at Site B	N/A	Permanently off
Output 4	Power Failure at Site B	Link Loss due to Power Failure at Site B	Link is up or down without power failure indication within the last two seconds

Table D-1: IDU-NetStream RM/DT - Output Alarms Description

Alarm	Description	Alarm On Conditions	Alarm Off Condition
Input 1			
Input 2	User Defined	Voltage in range	
Input 3	External Alarm	-10 to -50VDC	Voltage > 0VDC
Input 4

Appendix E

Setting Antenna Parameters

Antenna Issues

The choice of Tx Power, antenna gain and cable loss (between the radio and the antenna) determines the EIRP and is affected by such considerations as radio limitations and regulatory restrictions.

Before proceeding to antenna installation details, the following background information should be considered:

About Single and Dual Antennas

Each NetStream ODU has two radio transceivers (radios). The radios make use of algorithms that utilize both MIMO and Diversity resulting in enhanced capacity, range and link availability. The number of antennas (i.e. radios) used is determined by user configuration and by automatic system decisions, explained below.

Dual Antennas at the Both Link Sites

When using dual antennas at both sites (single dual-pole antenna or two single-pole antennas) you can choose between MIMO Mode and Diversity Mode.

MIMO Mode

Under this mode, the system doubles the link capacity. At the same time, it keeps the same rate and modulation per radio as was used with single antenna, thus increasing capacity, range and availability.

For example with a dual antenna NetStream can transmit at modulation of 64QAM and FEC of 5/6 and get an air rate of 130 Mbps, compared to 65 Mbps with single antenna.

To work in this mode, each antenna port must be connected to an antenna, the RSS level in both receivers should be balanced and a minimal separation between the antennas must be maintained. (For example, by using dual polarization antennas a cross polarization separation is attained).

Upon selecting Antenna Type as Dual, NetStream automatically selects this mode and doubles the air rates.

About Single and Dual Antennas

Link Manager indicates a case of unbalanced RSS between the two antennas.

Diversity Mode

Diversity Mode uses two antennas to improve the quality and reliability of the link. Often, there is not a clear line-of-sight (LOS) between transmitter and receiver. Instead the signal is reflected along multiple paths before finally being received.

Each such "bounce" can introduce phase shifts, time delays, attenuations, and even distortions that can destructively interfere with one another at the aperture of the receiving antenna. Antenna diversity is especially effective at mitigating these multi-path situations.

This is because multiple antennas afford a receiver several recordings of the same signal. Each antenna will be exposed to a different interference environment. Thus, if one antenna is undergoing a deep fade, it is likely that another has a sufficient signal. Collectively such a system can provide a robust link.

Antenna diversity requires antenna separation which is possible by using a dual-polarization antenna or by two spatially separated antennas.

Use Diversity instead of MIMO in the following situations:

- When the system cannot operate in MIMO Mode
- When one of the receivers has high interference compared to the second receiver (i.e. the system is "unbalanced")
- When you achieve higher capacity in Diversity Mode than in MIMO Mode
- When high robustness is of importance and the capacity of Diversity Mode is sufficient (up to 25 Mbps full duplex)

Single Antennas at Both Sites

By selecting a single antenna at both sites, the ODUs operate with a single radio that is connected to the ANT 1 connector. The second radio is automatically shut down.

Single at One Site, Dual Antennas at the Other

In this mode one of the sites uses the ODU with a single antenna while the other site uses the ODU with a dual antenna.

The advantages in this mode in comparison to using a single antenna in both sites are doubled total Tx Power and additional polarization and/or space diversity (depending on the polarization of installed antennas).

The air rates used in this mode are same as when using single antennas in both sites.

 Table E-1 summarizes the situation:

Table E-1: MIMO -	Diversity settings
-------------------	--------------------

Number of Antennas		Mode	Max Full Duplex	
Site A	Site B		Capacity	
2	2	MIMO	50 Mbps	
-	-	Diversity	25 Mbps	
2	1		25 Mbps	
1	2		25 Mbps	
1	1		25 Mbps	

The rates used by NetStream are shown in Table E-2 below:

Table E-2: NetStream Air rates

			Air-Rate [Mbps]	
Antenna	Antenna Modulation FEC		20 MHz CBW	40 MHz CBW
Single	BPSK	1/2	6.5	13.5
Single	QPSK	1/2	13	27
Single	QPSK	3/4	19.5	40.5
Single	16QAM	1/2	26	54
Single	16QAM	3/4	39	81
Single	64QAM	2/3	52	108
Single	64QAM	3/4	58.5	121.5
Single	64QAM	5/6	65	135
Dual	BPSK	1/2	13	27
Dual	QPSK	1/2	26	54
Dual	QPSK	3/4	39	81
Dual	16QAM	1/2	52	108
Dual	16QAM	3/4	78	162
Dual	64QAM	2/3	104	216
Dual	64QAM	3/4	117	243
Dual	64QAM	5/6	130	270

Considerations for Changing Antenna Parameters

Let:

max Available Tx Power denote the maximum Tx Power practically available from an ODU. (It appears as Tx Power per Radio.)

maxRegEIRP denote the maximum EIRP available by regulation. It will be determined by three factors:

- (3) per band/regulation
- (4) per channel bandwidth
- (5) antenna gain

maxRegTxPower denote the maximum regulatory Tx Power for the equipment, also having regard the above three points.

Then, the following relationship must be satisfied:maxAvailableTxPower min(maxRegEIRP- AntennaGain + CableLoss maxRegTxPower)

The Tx Power (per radio) indicates the power of each radio inside the ODU and is used for Link Budget Calculations. The Tx Power (System) shows the total transmission power of the ODU and is used to calculate the EIRP according to regulations.

- To see the relationship between Tx Power (radio) and Tx Power
 - (system), note that $dBm = 10 \log_{10} milliWatt$ so that if you double the power in milliWatts (for two radios) then dBm will

increase by 10 log 102 3.

- The Max EIRP level will be automatically set according to the selected band and regulation.
- The EIRP level is the sum of the System Tx Power and the Antenna Gain minus the Cable Loss.
- The Max EIRP level will be automatically set according to the selected band and regulation.
- The EIRP level is the sum of the System Tx Power and the Antenna Gain minus the Cable Loss.

The inequality (*) above is always satisfied by the system in accordance with the relevant regulation.

The precise relationship between the items in inequality (*) is as follows:

- Required Tx Power (per radio) will be adjusted down to the lesser of the value entered and maxAvailableTxPower
- Tx Power (system) is maxAvailableTxPower + 3 (for 2 radios)
- Max EIRP is maxRegEIRP.
- EIRP is maxAvailableTx Power + Antenna Gain Cable Loss

Regional Notice: French Canadian

Procédures de sécurité

Généralités

Avant de manipuler du matériel connecté à des lignes électriques ou de télécommunications, il est conseillé de se défaire de bijoux ou de tout autre objet métallique qui pourrait entrer en contact avec les éléments sous tension.

Mise à la terre

Tous les produits NetStream doivent être mis à la terre pendant l'usage courant. La mise à la terre est assurée en reliant la fiche d'alimentation à une prise de courant avec une protection de terre. En outre:

- La cosse de masse sur l' IDU-NetStream RM doit être constamment connectée à la protection de terre, par un câble de diamètre de 18 AWG ou plus. Le matériel monté sur rack doit être installé seulement sur des racks ou armoires reliés à la terre
- Une ODU doit mise à la terre par un câble de diamètre de 12 AWG ou plus
- Il ne doit pas y avoir de fusibles ou d'interrupteurs sur la connection à la terre

De plus:

- Il faut toujours connecter la terre en premier et la déconnecter en dernier
- Il ne faut jamais connecter les câbles de télécommunication à du matériel non à la terre
- Il faut s'assurer que tous les autres câbles sont déconnectés avant de déconnecter la terre

Protection contre la foudre

L'utilisation de dispositifs de protection contre la foudre dépend des exigences réglementaires et de l'utilisateur final. Toutes les unités extérieures NetStream sont conçues avec des circuits de limitation de surtension afin de minimiser les risques de dommages dus à la foudre. NetStream conseille l'utilisation d'un dispositif de parafoudre supplémentaire afin de protéger le matériel de coups de foudre proches.

Matériel supplémentaire requis

L'équipement requis pour l'installation du matériel est le suivant:

- Pince à sertir RJ-45 (si un câble pré-assemblé ODU/IDU n'est pas utilisé)
- Perceuse (pour le montage sur mur seulement)
- Câbles de terre IDU et ODU
- Clef 13 mm (½)
- Câble ODU IDU si non commandé (type extérieur, CAT 5e, 4 paires torsadées, 24 AWG)
- Colliers de serrage
- Ordinateur portable avec Windows 2000 ou Windows XP.

Précautions de sécurité pendant le montage de ODU

Avant de connecter un câble à l'ODU, la borne protectrice de masse (visse) de l'ODU doit être connectée à un conducteur externe protecteur ou à un pylône relié à la terre. Il ne doit pas y avoir de fusibles ou d'interrupteurs sur la connection à la terre.

Seulement un personnel qualifié utilisant l'équipement de sécurité approprié doit pouvoir monter sur le pylône d'antenne. De même, l'installation ou le démontage de ODU ou de pylônes doit être effectuée seulement par des professionnels ayant suivi une formation.

Pour monter l'ODU:

- a. Vérifier que les supports de fixation de l'ODU sont correctement mis à la terre.
- b. Monter l'unité ODU sur le pylône ou sur le mur; se référer à la Installation sur pylône et mur au dessous.
- c. Connecter la câble de terre au point de châssis sur l'ODU.
- d. Relier le câble ODU-IDU au connecteur ODU RJ-45.
- e. Visser les presses-étoupe de câbles pour assurer le scellement hermétique des unités ODU.
- f. Attacher le câble au pylône ou aux supports en utilisant des colliers classés UV.
- g. Répéter la procédure sur le site distant.

Ne pas se placer en face d'une ODU sous tension.

Connecter la terre à IDU-NetStream RM

Connecter un câble de terre de 18 AWG à la borne de masse de l'appareil. L'appareil doit être constamment connecté à la terre.

Installation sur pylône et mur

L' ODU ou l'O-PoE peuvent être montés sur un pylône ou un mur.

• Les appareils sont prévus pour être installés par un personnel de service.

- Les appareils doivent être connectés à une prise de courant avec une
- protection de terre.
 Le courant CC du IDU-NetStream RM doit être fourni par l'intermédiaire

d'un disjoncteur bipolaire et le diamètre du câble doit être de 14 mm avec un conduit de 16 mm.

Contenu du kit de montage ODU

Le kit de montage ODU comprend les pièces suivantes:

- une grande clame (voir Figure F-1)
- une *petite clame* (voir Figure F-2)
- un bras (voir Figure F-3)
- quatre visses hex tête M8x40
- deux visses hex tête M8x70
- quatre rondelles plates M8
- trois rondelles élastiques M8
- deux écrous M8.

Figure F-1: grande clame Figure F-2: petite clame

Figure F-3: bras

Montage sur un pylône

Serrer l'antenne au pylòne, en utilisant la pièce 6. Les visses et rendelles 7, 3, 4 comme indiqué. Utiliser un couple de serrage de 24 Nim.

Figure F-4: Montage sur un pylône

Montage sur un mur

ETAPE 3

Installer l'antenne sur le mur (maté riel fourni par le client)

Figure F-5: Montage sur un mur

Montage d'une antenne externe

L'antenne externe optionnelle peut être montée sur un pylône.

Contenu du kit de montage d'une antenne externe

Le kit de montage d'une antenne externe comprend les pièces suivantes

- Douze rondelles plates
- Huit rondelles élastiques
- Huit écrous hex
- Quatre boulons
- Un support en U
- Un support à pivotement
- Deux courroies de fixation en métal

Pour installer une antenne externe sur un pylône:

- 1. Attacher le support en U à l'arrière de l'antenne en utilisant quatre rondelles plates, quatre rondelles élastiques et quatre écrous hex.
- 2. Attacher le support à pivotement au support en U en utilisant huit rondelles plates, quatre rondelles élastiques, quatre écrous hex et quatre boulons.
- 3. Passer les deux courroies de fixation par les fentes verticales dans le support à pivot-ement.
- 4. Attacher l'antenne au pylône en utilisant les deux courroies de fixation .

Ajuster l'inclinaison nécessaire en utilisant l'échelle angulaire et serrer tous les boulons et écrous à la position requise.
